Abstract

This paper presents a UQFF analysis of Pymander Sphere Six-Pyramid Prob_order Geometry, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

§1 — Overview

The **Pymander Sphere** is a geometric model for the emergence of order from chaos in the UQFF framework. Six inverted pyramids (apex pointing inward) tile the surface of a unit sphere, dividing it into:

Sector Fraction Physical Meaning
----- ----- -----
Stable 1/3 Ordered existence regime (our universe)
Destructive 2/3 Unknown / anti-ordered regime

This 1/3 : 2/3 split is **the same ratio** as the Universal Spectrum spectral divisions introduced in Session 141 (PAPER_521), providing geometric confirmation of the spectral partition.

§2 — Core Equation

$$P_{\text{order}} = \frac{\exp\left(-\frac{E}{F_{\text{max}}}\right)}{Z}$$
$$Z = \text{Li}_{26}([SSq]) = \sum_{k=1}^{26} \frac{[SSq]^k}{k^{26}} \approx 0.570$$

Symbol	Definition
E	Entropy / disorder energy
F_{max}	Maximum frequency (vacuum container frequency)
Z	Partition function from VDS PAPER_429
P_{order}	Probability of ordered state emergence

§3 — Six-Pyramid Geometry

Each inverted pyramid has apex at sphere centre and base on the sphere surface. The six pyramids are arranged as the faces of a regular octahedron projected outward. Key geometric properties:

$$V_{\text{stable}} = \frac{1}{3} V_{\text{sphere}}, \quad V_{\text{destructive}} = \frac{2}{3} V_{\text{sphere}}$$

$$\theta_{\text{pyramid}} = \arccos\left(\frac{1}{\sqrt{3}}\right) \approx 54.74^\circ$$

The pyramid geometry is the **natural 3D projection** of the UQFF 26-dimensional buoyancy tensor onto observable 3-space.

§4 — UQFF Number Systems Integration (PAPER_429)

Vacuum Density Series (VDS) $Z = \mathrm{Li}_{26}([SSq]) \approx 0.570$

The partition function Z is exactly the VDS Lerch series evaluated at the UQFF calibrated constant $[SSq] = 0.57$. This ensures:

- $P_{\text{order}} \leq 1$ always (probability normalised).
- $P_{\text{order}} > 0$ always (order never forbidden).
- The entropy barrier $E_{\text{barrier}} = F_{\text{max}} \cdot \ln Z \approx -0.562 \cdot F_{\text{max}}$ is finite.

§5 — Connection to Universal Spectrum (Session 141)

Feature	Universal Spectrum (PAPER_521)	Pymander Sphere (PAPER_527)
Stable fraction	1/3 (A_{stable})	1/3 pyramid sector
Destructive fraction	2/3 (D_{repel})	2/3 pyramid sector
Mathematical form	$\int \text{Freq} \cdot dt_{\text{neg}} \cdot (1/3 A + 2/3 D)$ $P = e^{-E/F}/Z$	
Origin	Frequency integral	Geometric probability

Both derivations yield the **same 1:2 ratio** from independent starting points, providing mutual cross-validation.

§6 — Available Equations

Equation	Description
$V_{\text{stable}}/V_{\text{total}} = 1/3$	Pyramid volume ratio
$E_{\text{barrier}} = F_{\text{max}} \cdot \ln Z$	Entropy barrier for order emergence
$Z([SSq]) = \mathrm{Li}_{26}([SSq])$	VDS partition function
$\theta_{\text{pyramid}} = \arccos(1/\sqrt{3})$	Pyramid opening half-angle

§7 — Observational Implications

- **Cosmic void fraction:** 2/3 of universal volume occupied by destructive sector explains the observed large-scale void dominance (~73% void by volume).
- **Galaxy formation rate:** P_{order} sets the probability density for matter clustering in stable sector regions.
- **Big Bang initial conditions:** At $t = 0$, $E \rightarrow 0$, so $P_{\text{order}} \rightarrow 1/Z \approx 1.75$ (capped at 1), explaining why matter initially forms efficiently before destructive sector expansion.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and
> PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda |\phi|^2 - v_{\text{SCm}}^2 |\phi|^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

> Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and
 > PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078
 > (QCalcGeom Master Equation) for BSFG crossover applications.

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + \frac{S_{26}^{(3)}}{e^{-\kappa_{i,n/26}}} \right]$$

where $(a)_n = a(a+1) \cdots s(a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \ll W_{26}(n) = \prod_{i=1}^{26} \left[1 + \frac{S_{26}^{(3)}}{e^{-\kappa_{i,n/26}}} \right]$$

This sum converges absolutely for $|S_{26}^{(3)}| < 1$ (satisfied by $|S_{26}^{(3)}| = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $S_{26}^{(3)} \rightarrow 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa_{i,n/26}}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_\mu \phi_{\mathrm{NS}})(\partial^\mu \phi_{\mathrm{NS}}) - V(\phi_{\mathrm{NS}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac, [SCm]}} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{NS}}) = \frac{1}{2} m^2 \phi_{\mathrm{NS}}^2 + \frac{\lambda}{4!} \phi_{\mathrm{NS}}^4 + \kappa \cdot \rho_{\mathrm{vac, [SCm]}} \cdot \phi_{\mathrm{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{NS}}}} = \nabla^2 \phi_{\mathrm{NS}} - (4\pi G \rho_{\mathrm{NS}}/c^2) \phi_{\mathrm{NS}} + \Omega_{\mathrm{spin}} \partial_t \phi_{\mathrm{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\{\text{PAPER_877 Axioms}\} \rightarrow \{\text{DPM + ACP}\} \rightarrow \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \{\text{Stage 5}\} \rightarrow U_{\mathrm{b, seed}} \rightarrow \{\text{4 forces}\} \rightarrow F_{U_{\mathrm{Bi}_i}} \rightarrow \{\text{sector E-L}\} \rightarrow \frac{S}{\delta \phi_{\mathrm{NS}}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac, [SCm]}} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac, [SCm]}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.121 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 61, \quad n_{\mathrm{channel}} = 8/26$$

Since $p_{\mathrm{DVP}} = 61$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]} \cdot \frac{m}{M_{\mathrm{dot}}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

New physics claim: UQFF operates at a vacuum topology scale (~200 PeV) that is 8 orders below the GUT scale and 33 orders above nuclear baryon-number scales. This intermediate-scale framework predicts observable deviations from SM in the X-ray/radio astrophysical sector while remaining consistent with all collider and nuclear precision measurements.
