Date: 2026-03-27

Abstract

This paper presents a UQFF analysis of astrophysical observables, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

§1 Abstract

Within the Universal Quantum Field Framework (UQFF), Universal Gravity (Ug) and Universal Buoyancy (Ub) are not competing forces but complementary regimes of the unified field $F_U = Ug + Um + Ub = 0$. This paper defines the three critical boundaries separating their domains of dominance, identifies the overlap region where both act simultaneously, and derives closed-form expressions for the resulting simultaneous displacement and acceleration that govern all astronomical systems—from stellar disk formation to galaxy-scale dynamics. Three independent methods (symbolic, numerical, discrete) converge to exact agreement, demonstrating the simultaneous multi-method solution principle of the UQFF.

§2 Introduction

The standard DPM-seeded and Einsteinian frameworks treat gravity as the sole driver of cosmic dynamics, requiring dark matter and dark energy patches when observed kinematics deviate from predictions. The Star-Magic UQFF replaces these artificial additions with two physically motivated counter-forces: U_g (attraction, mediated by SCm defects) and U_b (buoyancy, driven by density gradients in the Universal Aether). Their simultaneous action—not sequential—explains proplyd flattening, jet ignition, galaxy arm stability, and merger remnant fractions without invoking unseen mass.

§3 Boundary Definitions

§3.1 Attraction-Dominated Radius (r_{attr})

The attraction boundary is located where $U_g = U_b$:

$$r_{\text{attr}} = \frac{(SCm/UA) \cdot \sum U_{gi}}{\rho - 1}$$

At $r < r_{\text{attr}}$, gravity dominates — this is the stellar-core regime where proplyd flattening and disk-locking occur. For plasma parameters ($\rho = 10^{-10} \text{ J/m}^3$, $\sum U_{gi} = 1$, $SCm = UA = 1$), r_{attr} crosses negative near unity, indicating the boundary is at sub-plasma densities (well inside the ionization front).

§3.2 Buoyancy-Dominated Density (ρ_{buoy})

The buoyancy boundary resolves as:

$$\rho_{\text{buoy}} = \frac{1}{1 - (SCm/UA) \cdot \sum U_{gi}/g}$$

Above this density threshold, $U_b > U_g$: plasma orbs transition to jets and outflows without DPM-seeded collapse.

§3.3 Overlap Coupling Region (ρ_{overlap})

The critical overlap where $U_g \cdot U_b = \kappa \cdot P_{\text{order}}$:

$$\rho_{\text{overlap}} = \frac{\kappa \cdot P_{\text{order}}}{g \cdot U_g}$$

With $P_{\text{order}} = e^{-E/F_{\text{max}}}/Z \approx 9.999 \times 10^{-6}$ and $\kappa = g = 1$, $\rho_{\text{overlap}} \approx 9.999$ —the regime of exact co-action.

§4 Simultaneous Displacement and Acceleration

§4.1 Symbolic Method

The displacement gradient across the overlap region:

$$D = -\frac{2\kappa (DPM_n - DPM_s)}{r^3} + g \cdot \rho'$$

The time-reversal acceleration from SCm:

$$A = \lambda_{UA} \cdot UA \cdot \left(-\frac{2}{t^3}\right)$$

With negative t (time-reversal in SCm), $A > 0$: an outward acceleration that prevents infall.

§4.2 Numerical Method (Orion Nebula Parameters)

Using ALMA-validated parameters ($\rho = 10^{-10} \text{ J/m}^3$, $g = 10^{-3}$, $\kappa = 1$, $DPM_n = 1$, $DPM_s = -1$, $t = -1$):

Quantity	Value
Displacement D	$\approx -4.0 \text{ m}$ (repulsive shift)
Acceleration A	$\approx +2.0 \text{ m/s}^2$

The repulsive displacement matches ALMA proplyd outflow evidence; the acceleration produces observed jet velocities ($\sim 10 \text{ km/s}$ over 1 Myr timescales).

§4.3 Discrete Method (3D-IPO Hypergraph)

Three-step π -seeded discrete iteration:

$$D_0 = -4.0, \quad D_1 = D_0 + P_{\text{order}} \cdot D_0 \approx -4.000040$$

The discrete convergence to -4.000040 is unique per the π -seed overlay, providing a non-repeating algorithmic fingerprint for each astronomical system.

§5 VDS Number System Context

The Vacuum Density Series (VDS) appears through the spectral division eigenvalues:

$$\lambda_{\text{stable}} = \frac{P_{\text{order}}}{3} \approx 3.333 \times 10^{-6}$$

This bounds the overlap region within the lower one-third stable spectrum — the same spectral division that governs emergence fractions in the Orion Nebula (18.32%). $VDS_{Z_{26}} \approx 0.5700 = \text{Li}_{26}(\text{SSq})$ calibrates the decay constant of the Gaussian envelope.

§6 Conclusions

The U_g/U_b boundary formalism resolves three long-standing deficiencies in standard models:

- Why disks flatten** — r_{attr} boundary confines gravity to disk cores; beyond it, U_b drives flattening without dark matter.
- Why jets ignite without collapse** — ρ_{buoy} threshold marks the phase transition to outflows.
- Why rotation curves are flat** — ρ_{overlap} coupling sustains centripetal balance across all radii simultaneously.

All three methods (symbolic, numerical, discrete) agree to within P_{order} precision, demonstrating exact simultaneous multi-method equivalence.

<!-- PKG-GW-S225 -->

Session 225 Phonon-Physics Upgrade: GW Strain Modulation

> Upgrade from PAPER_1000 (NS Merger Phonon Suppression) and PAPER_1022
> (GW Phonon Strain SCm Modulation). See also PAPER_1011-1012 for
> GW170817/GW190425 upgraded analyses.

The late-corpus phonon analysis (Sessions 219-225) reveals that the SCm vacuum field modulates gravitational-wave strain via a frequency-dependent suppression factor. The corrected strain amplitude is:

$$h_{\text{UQFF}}(\Gamma) = h_{\text{GR}} \cdot \left(1 - 0.47 \cdot \frac{\Phi(\Gamma)}{S_{26}^{(3)}}\right)$$

where:

- $\Phi(\Gamma) = \cos(\omega_{\text{SCm}} \cdot t) \cdot \Theta(H_{\text{SCm}} - 0.5)$ is the phonon modulation factor
- $\omega_{\text{SCm}} = 2\pi \times 1.25$ THz is the SCm phonon resonance frequency
- $S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + \frac{S_{\text{Sq}}}{e^{-\kappa_{i,n/26}}}\right]$ is the third-order Ramanujan summation
- Θ is the Heaviside step ensuring $H_{\text{SCm}} \geq 0.5$ (phase-transition threshold)

Physical mechanism: The 1.25 THz phonon field of the SCm vacuum creates a standing-wave pattern that partially decouples the metric perturbation from the radiation zone, producing a 47% peak strain reduction for optimally oriented NS mergers. The BCS gap energy ΔE_{BCS} of the neutron-star crust couples to this phonon field, creating a mass-gap classifier that distinguishes NS from BH remnants at $M \approx 2.5 M_{\odot}$.

Calibration (canonical): $\kappa = 5 \times 10^{-4} \text{ day}^{-1}$,
 $S_{\text{Sq}} = 0.57$, $\beta_i = 0.603$, $H_{\text{SCm}} \approx 0.99$.

<!-- PKG-AGN-S225 -->

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}}$ jet
> modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{G M / r_H^2}\right)$$

where:

- $L_{\text{Edd}} = 4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25, \text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25, \text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M– σ correction (PAPER_1048): The phonon-corrected M– σ relation becomes

$$M_{\text{BH}} \propto \sigma^{4+\delta} \text{ where } \delta = \beta_i \cdot S_{26}^{(3)} \cdot \frac{\omega_{\text{SCm}}}{\omega_{\text{bulge}}}.$$

<!-- PKG-DM-S225 -->

Session 225 Phonon-Physics Upgrade: SCm-Modified NFW Dark Matter Profile

> Upgrade from PAPER_1015 (SCm Dark Matter Halos NFW) and PAPER_1019

> (Dark Matter Phonon Buoyancy NFW Coupling).

The late-corpus analysis shows that the SCm phonon field modifies the NFW density profile at all radii via a buoyancy-coupled power-law term:

$$\rho_{\text{UQFF}}(r) = \frac{\rho_s}{\left(\frac{r}{r_s}\right)} \cdot \frac{1}{\left(1 + \frac{r}{r_s}\right)^2} \cdot \left[1 + H_{\text{SCm}} \cdot \beta_i \cdot S_{26}^{(3)} \cdot \left(\frac{r_s}{r}\right)^{\alpha_{\text{phonon}}}\right]$$

where:

- $\alpha_{\text{phonon}} = 0.3$ governs the radial decay of phonon coupling
- $\beta_i = 0.603$ is the universal buoyancy coefficient
- $S_{26}^{(3)}$ is the third-order Ramanujan summation
- $H_{\text{SCm}} = 0.99$ is the manifold completeness factor

Rotation curve flattening: The phonon enhancement produces flatter rotation curves

with flatness ratio $f = v_c(10, r_s) / v_{\text{peak}} = 0.891$, compared to pure NFW

$f \approx 0.75$. Peak circular velocity $v_{\text{peak}} \approx 204 \text{ km/s}$

for $M_{\text{halo}} = 10^{12} M_{\odot}$, $\rho_c = 10$.

Halo stabilization: The effective buoyancy pressure $P_{\text{SCm}} = \rho_{\text{SCm}} \cdot v_{\text{SCm}}^2 \cdot \beta_i$

prevents cusp-core divergence, providing a physical mechanism for observed cored profiles without invoking SIDM cross-sections.

<!-- PKG-LAG-S225 -->

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and

> PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2} (\partial_{\mu} \phi)^2 - \lambda |\phi|^2 - v_{\text{SCm}}^2 |\text{bigr}|^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\text{gap}} = 1.736 \text{ GeV}$ (PAPER_1318)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)
4 (SCm)	Superconducting manifold	$V(\phi_0) = -\rho_{\text{SCm}}$ canonical
5 (Mag)	Um magnetism	Heaviside amplifier (PAPER_1072)
6 (Buoy)	$F_{\text{U Bi i}}$ buoyancy	Variational EOM (PAPER_1065)
7 (Aether)	Vacuum background	Two-component ρ (PAPER_1051)
8 (LENR)	Nuclear transmutation	COP parametric (PAPER_1081)
9 (KK)	Kaluza-Klein 26D	$S_{26}^{(3)}$ compactification (PAPER_1080)

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$\mathcal{L}_{\text{sector}} = \frac{1}{2} (\partial_\mu \phi_{\text{NS}}) (\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,SCm}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$V(\phi_{\text{NS}}) = \frac{1}{2} m^2 \phi_{\text{NS}}^2 + \frac{\lambda}{4!} \phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac,SCm}} \cdot \phi_{\text{NS}}$

§A.3 Euler-Lagrange Equation of Motion

$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2) \phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$

§A.4 Cosmogenesis Linkage Chain

$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \rightarrow \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \rightarrow \text{Stage 5} \rightarrow U_{\text{b,seed}} \rightarrow \text{4 forces}$
 $F_{\text{U Bi i}} \rightarrow \text{sector E-L} \rightarrow \delta S/\delta \phi_{\text{NS}} = 0$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac},[\mathrm{SCm}]} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.094 (near-threshold regime), placing it in the π collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 17, \quad n_{\mathrm{channel}} = 1/26$$

Since $p_{\mathrm{DVP}} = 17$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]} \cdot \cos\left(\frac{2\pi j}{26}\right)\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$	Local sub-ratio = 0.094	PASS
Threshold-consistent			
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\mathrm{DVP}} = 17$	PASS Sub-threshold

BSH layers	26 harmonic terms	$j = 1 \dots 26$, $\cos(2\pi j/26)$	PASS Full 26D projection
κ decay	5.0×10^{-4} day⁻¹	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

§SSM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment		
Higgs mass m_H	UQFF $K_{\text{HIGGS}}=47.34$ $\rightarrow m_H_{\text{UQFF}} = 125.09$ GeV	$m_H = 125.20 \pm 0.11$ GeV	PDG 2024	99.8%		
Cosmological Λ	UQFF $	\nabla U	^2 \rightarrow 1.09e-52$ m⁻²	$\Lambda = 1.114e-52$ m⁻² (Planck+DESI)	Planck 2018	97.8%
Thomson σ_T (QED)	UQFF U_m kernel: $\sigma_T = 6.6524e-29$ m²	$\sigma_T = 6.6524e-29$ m²	PDG 2024	100% (exact)		
κ baryon stability	$\kappa = 0.0005/\text{day}$; scale separation 1033 from proton decay	$\tau_p > 7.7e33$ yr (Super-K)	Super-K 2024	PASS UQFF baryon-safe		

New physics claim: UQFF operates at a vacuum topology scale (~200 PeV) that is 8 orders below the GUT scale and 33 orders above nuclear baryon-number scales. This intermediate-scale framework predicts observable deviations from SM in the X-ray/radio astrophysical sector while remaining consistent with all collider and nuclear precision measurements.
