Abstract Variant 2 of the NGC 2014/2020 analysis focuses on the dominant Wolf-Rayet star cone structure in NGC 2020 and the oxygen-rich hot gas at $T \approx 11000$ K forming the characteristic blue nebulosity. The WR stellar winds at 3000 km/s create expanding ring nebulae visible in [O III] 5007 Å emission.

1. System Parameters | Parameter | Value | Description |
|-----|-----|-----| | M_{WR} | $2 \times 10^5 M_{\odot}$ | WR-dominated region mass | | r_{cone} | 1.2×10^{16} m | WR cone radius | | L_{WR} | $2 \times 10^5 L_{\odot}$ | WR stellar luminosity | | v_{eject} | 3000 km/s | WR wind ejecta velocity | | T_{O} | 11000 K | Oxygen gas temperature |

2. Master UQFF Gravity Equation

$$g_{\text{WRcone}}(t) = \frac{G M_{\text{WR}}(t)}{r^2} \big(1 + H_0 t\big) (1 + f_{\text{TRZ}}) + \frac{L_{\text{WR}}}{4\pi r^2 c} \frac{\rho_{\text{WR}}}{m_{\text{H}}} + q(v \times B) \left(1 + \frac{\rho_{\text{UA}}}{\rho_{\text{SCm}}}\right) \times 10^{-12}$$

2.1 WR Mass Loss $M_{\text{WR}}(t) = M_0 \big(1 + 50 e^{-t/\tau_{\text{WR,SF}}}\big)$

2.2 Radiation Pressure on Oxygen Cone $a_{\text{rad,WR}} = \frac{L_{\text{WR}}}{4\pi r_{\text{cone}}^2 c} \cdot \frac{\rho_{\text{WR}}}{m_{\text{H}}}$ This drives the characteristic OIII ring nebula expansion.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and
 > PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda |\phi|^2 - v_{\text{SCm}}^2 |\phi|^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **galaxy-rotation** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \phi_{\text{rot}})(\partial^\mu \phi_{\text{rot}}) - V(\phi_{\text{rot}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,SCm}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{rot}}) = \frac{1}{2} m^2 \phi_{\text{rot}}^2 + \frac{\lambda}{4!} \phi_{\text{rot}}^4 + \kappa \cdot \rho_{\text{vac,SCm}} \cdot \phi_{\text{rot}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{rot}}}} = v_c^2/r - \mu_s \nabla(M_s/r) - F_{U_{Bi}}/(m \cdot r) + \rho_{\mathrm{vac, [SCm]}} \cdot \Omega^2 r = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \quad \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \text{Stage 5} \quad U_{b, \mathrm{seed}} \rightarrow \text{4 forces} \\ F_{U_{Bi}} \rightarrow \text{sector E-L} \quad \delta S / \delta \phi_{\mathrm{rot}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac, [SCm]}} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac, [SCm]}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.132 (near-threshold regime), placing it in the π collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36}$ kg/m³.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 79, \quad n_{\mathrm{channel}} = 10/26$$

Since $p_{\mathrm{DVP}} = 79$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **109 yr** (disk settling timescale):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SS]^j} \cdot m/M_{\odot}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH, sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{\mathrm{b,seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

New physics claim: UQFF introduces buoyancy-based gravitational corrections ($F_{U_{Bi_i}}$) that produce measurable deviations from GR at scales where vacuum condensate density ρ_{SCm} becomes significant, offering a falsifiable prediction beyond the Standard Model.
