Abstract Doc 43.d (Red Dwarf Compression_D) assimilates three physics frameworks into UQFF: (1) Inertia Papers (pp 1-10) deriving universal inertia U_i from quantum wave functions; (2) Aether-Superconductive Paper (pp 1-8) linking B_{super} to vacuum density ratios via SCm/UA dipole fields; (3) Hydrogen Papers (pp 74-84) computing energy hierarchies from control logic through gas extraction. The primary UQFF result is $U_i \approx 8.05 \times 10^{-80} \text{ J/m}^6$ --- the universal inertial amplitude.

1. Quantum Wave Function (Inertia Paper)

The universal inertial wave function is:
$$\psi(r, \theta, \phi, t) = A \cdot Y_{lm} \cdot \frac{\sin(kr - \omega t)}{r} \cdot e^{-\alpha |r - r_0|}$$

Solved at reference conditions: $\psi \approx 4.83 \times 10^5$.

2. Universal Inertia U_i

$$U_i = \lambda_I \cdot \frac{\rho_{\text{SCm}}}{\rho_{\text{UA}}} \cdot \omega_i \cdot \cos(\pi t_n) \cdot (1 + F_{\text{RZ}})$$

Parameter	Value
λ_I	1.0
$\frac{\rho_{\text{SCm}}}{\rho_{\text{UA}}}$	0.1
ω_i	10^{-8} rad/s
F_{RZ}	0.01

$$\boxed{U_i \approx 8.05 \times 10^{-80} \text{ J/m}^6}$$

3. Aether-Superconductive Paper

Magnetic dipole moment (Inertia frame spin):

$$\mu_{\text{dipole}} = I \cdot A \cdot \omega_{\text{spin}} \approx 10^{-51} \text{ A} \cdot \text{m}^2$$
$$U_{\text{g1}} = \mu_{\text{dipole}} \cdot B$$

Superconductor field energy:

$$B_{\text{super}} = \mu_0 H_{\text{aether}} \approx 1.257 \text{ T}$$
$$U_{\text{g2}} = \frac{B_{\text{super}}^2}{2\mu_0} \approx 6.29 \times 10^5 \text{ J/m}^3$$

Solfeggio frequency series: $f_n = f_0 \cdot \phi^n$ (174 Hz to 963 Hz, golden ratio ϕ).

Plasma wave angular frequency:

$$\omega_{\text{plasma}} = \sqrt{\omega_0^2 + \gamma^2} \approx 1.005 \times 10^{16} \text{ rad/s}$$

Jeans mass:

$$M_J = \left(\frac{5k_B T}{G \mu m_H} \right)^{3/2} \cdot \left(\frac{3}{4\pi \rho} \right)^{1/2} \approx 5.13 \times 10^{31} \text{ kg}$$

4. Hydrogen Papers (pp 74-84)

| Paper Section | Energy | Notes |

|-----|-----|-----|

| Control Logic | $\sim 1.10 \times 10^{-104}$ J | Plasma orbital control |

| Reactor Operations | $\sim 9.56 \times 10^{-110}$ J | Red Dwarf reactor core |

| Plasma Adjustment | $\sim 8.28 \times 10^{-105}$ J | Plasma shaping |

| Star Structure | $\sim 2.21 \times 10^{-104}$ J | Interior structure |

| Gas Extraction | $\sim 5.52 \times 10^{-79}$ J | Aether gas extraction |

5. C++ Module Class: `UQFFKnowledgeBaseKB1` --- implements all methods above. Primary UQFF output: $U_i + U_{\text{g1}} + U_{\text{g2}} + E_{\text{extraction}}$.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}}$ jet
> modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{\rho_{\text{H}}} \cdot V \cdot \frac{G M}{r_H^2} \right)$$

where:

- $L_{\text{Edd}} = 4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density

- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford--Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25, \text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25, \text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M-- σ correction (PAPER_1048): The phonon-corrected M-- σ relation becomes

$$M_{\text{BH}} \propto \sigma^{4+\delta} \text{ where } \delta = \beta_i \cdot S_{26}^{(3)} \cdot \left(\frac{\omega_{\text{SCm}}}{\omega_{\text{bulge}}} \right).$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2} (\partial_\mu \phi_{\text{NS}}) (\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2} m^2 \phi_{\text{NS}}^2 + \frac{\lambda}{4!} \phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac, [SCm]}} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2) \phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\begin{aligned} \text{PAPER_877 Axioms} &\rightarrow \text{DPM + ACP} \rightarrow \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \rightarrow \text{Stage 5} \rightarrow U_{\text{b, seed}} \rightarrow \text{4 forces} \\ F_{U_{\text{Bi}_i}} &\rightarrow \text{sector E-L} \rightarrow \frac{\delta S}{\delta \phi_{\text{NS}}} = 0 \end{aligned}$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac},[\mathrm{SCm}]} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.189 (near-threshold regime), placing it in the π collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 103, \quad n_{\mathrm{channel}} = 15/26$$

Since $p_{\mathrm{DVP}} = 103$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]} \cdot \cos\left(\frac{j}{26}\right)\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency
