Abstract Doc 43.e (Red Dwarf Compression_E) extends the hydrogen series to pages 85-88, deriving compressed space energy E_{space} , an Earth-Moon tidal analogy using di-pseudo-monopole fields, hydrogen radial probability energies E_{1s} and E_{3d} , and the 26-level quantum wave energy $E_k(t)$ that maps atomic orbital time scales to galactic orbital periods.

1. Compressed Space Energy

$E_{\text{space}} = E_0 \cdot \text{Spatial}_f \cdot \text{Compression} \cdot \text{Layers} \cdot f_{\text{Higgs}} \cdot t_{\text{prec}} \cdot Q_{\text{scale}}$

with $E_0 = 1.683 \times 10^{-37}$ J (aether base), $f_{\text{Higgs}} = 8 \times 10^{-34}$,
 $t_{\text{prec}} = 6.183 \times 10^{-13}$:
 $\boxed{E_{\text{space}} \approx 5.52 \times 10^{-104} \text{ J}}$

2. Earth-Moon Tidal Analogy

Di-pseudo-monopole (SCm:UA') field analogy to Earth-Moon tidal system:

$E(t) = E_{\text{aether}} \cdot V \cdot \frac{B_{\text{pseudo}}^2}{2\mu_0 E_{\text{aether}}} \cdot \sin\left(\frac{2\pi}{T}t\right) \cdot f_{\text{spatial}}$

with $B_{\text{pseudo}} = 1$ T, $T = 2.36 \times 10^6$ s (orbital period), $f_{\text{spatial}} = 2$:
 $E(T/4) \approx 7.96 \times 10^{-22} \text{ J} \cdot \text{UQFF}$

UQFF/SM calibration ratio: $\sim 10^{38} - 10^{39}$ (SCm:UA di-pseudo-monopole vs SM tidal).

3. Hydrogen Radial Probability

Energies at quarter-period for principal quantum states:

| State | $E(T/4)$ |

----- -----
\$n=1, l=0\$ (1s) \$3.98\times10^{-22}\$ J
\$n=3, l=2\$ (3d) \$1.99\times10^{-22}\$ J

$$E_{nlm}(t) = E_{\text{aether}} \cdot V \cdot \frac{B_{\text{pseudo}}^2}{2\mu_0 E_{\text{aether}}} \cdot |\psi_{nlm}|^2 r_{\text{max}}^2 \cdot \sin\left(\frac{2\pi}{T}t\right)$$

4. 26-Level Quantum Wave

$$E_k(t) = E_{\text{aether}} \cdot V \cdot \frac{B_{\text{pseudo}}^2}{2\mu_0 E_{\text{aether}}} \cdot |Y_{lm}|^2 \cdot \sin\left(\frac{2\pi}{T_k}t\right)$$

where $T_k = \frac{k}{26} \cdot T_{\text{Earth-Moon}}$ links atomic timescales to galactic rotation.

Level \$k\$	\$T_k\$ (s)	\$E_k(T_k/4)\$ (J)
----- ----- -----		
1	\$9.08\times10^4\$	\$5.31\times10^{-23}\$
6	\$5.45\times10^5\$	\$2.37\times10^{-22}\$

Spherical harmonics used: $|Y_{0,0}|^2 \approx 0.0796$, $|Y_{2,\pm 2}|^2_{\text{max}} \approx 0.596$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and
> PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda \bigl(\phi^2 - v_{\text{SCm}}\bigr)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **quantum-vacuum** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2} (\partial_\mu \phi_{\mathrm{vac}}) (\partial^\mu \phi_{\mathrm{vac}}) - V(\phi_{\mathrm{vac}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{vac}}) = \frac{1}{2} m^2 \phi_{\mathrm{vac}}^2 + \frac{\lambda}{4!} \phi_{\mathrm{vac}}^4 + \kappa \cdot \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \phi_{\mathrm{vac}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{vac}}} = \hat{H}\phi = (\hat{T} + \hat{V}_{\mathrm{vac},[\mathrm{SCm}]})\phi + \hbar\omega_{\mathrm{ZPE}}/2 = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \rightarrow \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \text{Stage 5} \rightarrow U_{b,\mathrm{seed}} \rightarrow \text{4 forces} \rightarrow F_{U_{Bi}} \rightarrow \text{sector E-L} \rightarrow \delta S / \delta \phi_{\mathrm{vac}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac},[\mathrm{SCm}]} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.104 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 107, \quad n_{\mathrm{channel}} = 16/26$$

Since $p_{\mathrm{DVP}} = 107$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is $\hbar/E$ (vacuum fluctuation lifetime):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]} \cdot \cos\left(\frac{2\pi j}{26}\right)\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency
