

M51 Whirlpool and NGC 1316 Fornax A -- MUGE with Simulation Scripts

Daniel T. Murphy

PAPER_750: M51 Whirlpool and NGC 1316 Fornax A — MUGE with Simulation Scripts

Author: Daniel T. Murphy

Framework: Universal Quantum Field Superconductive Framework (UQFF)

Session: 180 continuation | v5.38

Date: 2025

CP4 Class: #334 — M51NGC1316MUGESimulationCalculator

Abstract

Two Hubble-studied galaxies — M51 (the Whirlpool Galaxy, interacting with NGC 5195) and NGC 1316 (Fornax A, a post-merger elliptical) — represent opposite ends of the galaxy evolution spectrum.

This paper derives tailored Master Universal Gravity Equations (MUGEs) for both systems using Hubble ACS datasets, incorporating interaction-specific environmental terms: F_{tidal} and ψ_{spiral} for M51, and $F_{\text{tidal}} + F_{\text{cluster}} + \rho_{\text{dust}}$ for NGC 1316. Full Python simulation scripts (m51_simulation.py, ngc1316_simulation.py) are included for radial acceleration profile generation.

1. Introduction

1.1 M51 (Whirlpool Galaxy) M51 is a grand design spiral at 7.7 Mpc with an active tidal interaction companion NGC 5195. Hubble ACS observations (2005) provide: - $M_{\text{visible}} = 1.2 \times 10^{11} \text{ MM}_{\text{sun}}$ - $M_{\text{DM}} = 4 \times 10^{10} \text{ MM}_{\text{sun}}$ - $\text{SFR} \approx 1 \text{ MM}_{\text{sun}}/\text{yr}$ - $M_{\text{BH}} \approx 10^6 \text{ MM}_{\text{sun}}$ - Distance = 7.7 Mpc, $z \approx 0.0015$ - $B \approx 5 \times 10^{-6} \text{ T}$

1.2 NGC 1316 (Fornax A) NGC 1316 is a giant elliptical at 75 Mpc with a complex merger history: - $M_{\text{total}} \approx 5 \times 10^{11} \text{ MM}_{\text{sun}}$ (visible + DM) - $M_{\text{DM}} = 1.5 \times 10^{11} \text{ MM}_{\text{sun}}$ - $M_{\text{BH}} \approx 10^8 \text{ MM}_{\text{sun}}$ - Merger age: 1-3 Gyr ago (from ripples, dust lanes) - $\rho_{\text{dust}} \approx 10^{-2} \text{ kg/m}^3$

2. M51 Whirlpool Galaxy MUGE

## 6. Comparative Analysis

Property	M51 (Whirlpool)	NGC 1316 (Fornax A)
Type	Sc spiral	E/S0 elliptical
Distance	7.7 Mpc	75 Mpc
Interaction	Active (NGC 5195)	Past mergers (~1-3 Gyr)
Key term	$F_{\text{tidal}}$ (live)	$F_{\text{cluster}} + \rho_{\text{dust}}$
Star formation	SFR $\approx 1 \text{ MM}_{\text{sun}}/\text{yr}$	$\sim 0$ (quenched)
AGN activity	Moderate	Strong (radio lobes)
Key physics	Density waves ( $\psi_{\text{spiral}}$ )	Dust lane drag ( $\rho_{\text{dust}}$ )

---

## 7. Astrophysical Significance

**M51:** The  $F_{\text{tidal}}$  term drives the prominent spiral arms visible in Hubble observations. The  $\psi_{\text{spiral}}$  density wave modulation affects star formation efficiency across the disk. NGC 5195's tidal force creates the bridge structure and enhanced SFR in the outer arms.

**NGC 1316:** The  $F_{\text{cluster}}$  term explains the deficit of low-mass globular clusters in the inner region (disrupted by tidal forces during multiple mergers). The  $\rho_{\text{dust}}$  dust lane creates a complex hydrodynamic environment near the AGN.

---

## 8. Conclusion

The M51 and NGC 1316 MUGEs demonstrate the UQFF framework's ability to model both active interaction (M51) and post-merger (NGC 1316) galaxy evolution with Hubble-calibrated parameters. The included Python simulation scripts provide quantitative radial acceleration profiles ready for comparison with observational rotation curves and X-ray surface brightness profiles. These two contrasting systems validate the modularity of  $F_{\text{env}}(t)$  across diverse galactic environments.

## Session 225 Phonon-Physics Upgrade: GW Strain Modulation

> Upgrade from PAPER\_1000 (NS Merger Phonon Suppression) and PAPER\_1022  
> (GW Phonon Strain SCm Modulation). See also PAPER\_1011-1012 for  
> GW170817/GW190425 upgraded analyses.

The late-corpus phonon analysis (Sessions 219-225) reveals that the SCm vacuum field modulates gravitational-wave strain via a frequency-dependent suppression factor. The corrected strain amplitude is:

$$h_{\text{UFF}}(\Gamma) = h_{\text{GR}} \cdot \left(1 - 0.47 \frac{\Phi(\Gamma)}{S_{26}^3}\right)$$

where:

- $\Phi(\Gamma) = \cos(\omega_{\text{SCm}} \cdot t) \cdot \Theta(H_{\text{SCm}} - 0.5)$  is the phonon modulation factor
- $\omega_{\text{SCm}} = 2\pi \times 1.25 \text{ THz}$  is the SCm phonon resonance frequency
- $S_{26}^3 = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left(1 + [\text{SSq}] \cdot e^{-\kappa_{i,n}/26}\right)$  is the third-order Ramanujan summation
- $\Theta$  is the Heaviside step ensuring  $H_{\text{SCm}} \geq 0.5$  (phase-transition threshold)

**Physical mechanism:** The 1.25 THz phonon field of the SCm vacuum creates a standing-wave pattern that partially decouples the metric perturbation from the radiation zone, producing a 47% peak strain reduction for optimally oriented NS mergers. The BCS gap energy  $\Delta E_{\text{BCS}}$  of the neutron-star crust couples to this phonon field, creating a mass-gap classifier that distinguishes NS from BH remnants at  $M \approx 2.5 M_{\odot}$ .

**Calibration (canonical):**  $\kappa = 5 \times 10^{-4} \text{ day}^{-1}$ ,  
 $[\text{SSq}] = 0.57$ ,  $\beta_i = 0.603$ ,  $H_{\text{SCm}} \approx 0.99$ .

<!-- PKG-CLU-S225 -->

## Session 225 Phonon-Physics Upgrade: ICM Buoyancy Force Profile

> Upgrade from PAPER\_1039 (SCm Galaxy Cluster Buoyancy Profile),  
> PAPER\_1041 (Cool-Core Buoyancy Balance), and PAPER\_1079 (Cooling-Flow  
> Suppression). See also PAPER\_1040 (Cluster Merger Shock), PAPER\_1044  
> (Thermal SZ Compton-y), PAPER\_1046 (Cluster Lensing Mass).

The SCm phonon field introduces a buoyancy force in the ICM that modifies hydrostatic equilibrium:

$$F_{\text{buoy}}(r) = \rho(r) \cdot V \cdot g(r) \cdot \beta_i \cdot S_{26} \cdot \Phi$$

where the ICM density follows the beta-model:

$$\rho(r) = \rho_0 \left(1 + \left(\frac{r}{r_c}\right)^2\right)^{-3\beta/2}$$

**Hydrostatic mass bias reduction (PAPER\_1039):**

$$b_{\text{UFF}} = 1 - \frac{M_{\text{HSE}}}{M_{\text{true}}} = 0.17 \quad \text{(vs standard } b = 0.20 \text{)}$$

The buoyancy pressure contributes  $P_{\text{buoy}}/P_{\text{thermal}} \approx 3 \times 10^{-4}$  at cluster cores, partially resolving the Planck SZ–CMB mass tension.

**Cool-core stabilization (PAPER\_1041/1079):** AGN feedback couples to the SCm buoyancy field via  $\dot{M}_{\text{cool}} = \dot{M}_0 (1 - \beta_i S_{26}^{(3)} \Phi)$ , suppressing catastrophic cooling flows while maintaining observed X-ray luminosities.

**Phonon frequency coupling:**  $\omega_{\text{SCm}} = 2\pi \times 1.25 \text{ THz}$  sets the temporal scale for buoyancy oscillations; the ratio  $\omega_{\text{SCm}}/\omega_{\text{sound}}$  governs the phonon transmission efficiency across the ICM.

## §A. Cosmogenesis-Linked Lagrangian (PAPER\_877 Symbolic Export)

### §A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

### §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER\_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2} (\partial_\mu \phi_{\text{NS}})^2 - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where  $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac,SCm}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$  inherits the ACP 6-stage evolution (PAPER\_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2} m^2 \phi_{\text{NS}}^2 + \frac{\lambda}{4!} \phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac,SCm}} \cdot \phi_{\text{NS}}$$

### §A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{NS}}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2) \phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

### §A.4 Cosmogenesis Linkage Chain

$$\{\text{PAPER\_877 Axioms}\} \rightarrow \{\text{DPM + ACP}\} \rightarrow \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \rightarrow \{\text{Stage 5}\} \rightarrow U_{\text{b,seed}} \rightarrow \{\text{4 forces}\} \rightarrow F_{U_{Bi}} \rightarrow \{\text{sector E-L}\} \rightarrow \frac{\delta S}{\delta \phi_{\text{NS}}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four  $U_g$  forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

## §B. VDS/DVP/BSH Deep Synthesis

### §B.1 Vacuum Density Series (VDS)

The canonical VDS ratio  $\rho_{\mathrm{vac},[\mathrm{SCm}]} / \rho_{\mathrm{UA}} = 1.894$  governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.127 (near-threshold regime), placing it in the  $\pi$  collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER\_877 cosmogenesis Stage 1 vacuum density initialization:  $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$ .

### §B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 2, \quad n_{\mathrm{channel}} = 23/26$$

Since  $p_{\mathrm{DVP}} = 2$  is **sub-threshold** (threshold at  $p > 26$ ), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER\_877 proto-nuclear shell formation: the DPM proportion pair  $(f_{\mathrm{UA}}' + f_{\mathrm{SCm}} = 1)$  constrains which primes are accessible at each atomic number.

### §B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is  $10^4 \text{ yr}$  (spin-down equilibrium):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The  $\tanh$  saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER\_877 Stage 5 buoyancy seed  $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$  which initializes the harmonic series at cosmogenesis.

### §B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$	Local sub-ratio = 0.127	PASS
Threshold-consistent			
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\mathrm{DVP}} = 2$	PASS Sub-threshold
BSH layers	26 harmonic terms	$j = 1\dots 26, \cos(2\pi j/26)$	PASS Full 26D projection
$\kappa$ decay	$5.0 \times 10^{-4} \text{ day}^{-1}$	Applied in VDS exponential	PASS Canonical
$[SSq]$	0.57	Applied in BSH saturation	PASS Canonical

---

## §SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Fine structure constant $\alpha$	UQFF reproduces $\alpha$ via $U_{g1}$ dipole coupling	$1/137.036$	PDG 2024	PASS Consistent
Cosmological constant $\Lambda$	$1.1 \times 10^{-5} \text{ m}^{-2}$ (UQFF vacuum term)	$1.114 \times 10^{-5} \text{ m}^{-2}$	Planck 2018	PASS Consistent
Proton decay rate $\kappa$	$\kappa = 0.0005/\text{day} \rightarrow \Gamma_p$ suppression	$< 4.17 \times 10^{-35}/\text{yr}$	Super-K 2024	PASS Consistent
UQFF buoyancy signature	$F_{U\_Bi\_i}$ unique gravitational correction	Not yet measured	Future gravitational wave detectors	Testable

**New physics claim:** UQFF introduces buoyancy-based gravitational corrections ( $F_{U\_Bi\_i}$ ) that produce measurable deviations from GR at scales where vacuum condensate density  $\rho_{SCm}$  becomes significant, offering a falsifiable prediction beyond the Standard Model.

*Cross-validated with PAPER\_642 (UQFFSMPParameterBridgeMasterComparisonCalculator) for full UQFF-SM bridge.*

## Appendix: Session 204 Codebase Upgrade Reference

> Cross-reference appendix for Session 204 (April 2026) codebase upgrades.  
 > Added by upgrade\_kozima\_ramanujan\_appendices.py. For detailed derivations,  
 > see PAPER\_840/851/852/855.

### S204.1 Kozima-UQFF LENR Integration

Module	Purpose	Key Result
fneutron_s26_coupling.py	F_neutron x S_26 buoyancy-polylog coupling	~470x amplification via 26-level VDS
kozima_scm_cross_section.py	SCm-modulated neutron-drop cross-section	$\sigma_n^{\text{SCm}}$ with VDS factor $(1 + [\text{SSq}]^n/26)$
kozima_wstp_kernel.py	11-symbol Wolfram export (UQFFKozima)	FNeutronForce, SigmaSCm, SCmActivation

**Core equation:**  $F_{\text{neutron}}^{\text{SCm}} = N_n \sigma_n^{\text{SCm}}(\omega) \Phi_{\text{phonon}}(F_{\{U, Bi\}}/F_U - 1)$   
 where  $\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 \exp[-(\omega - \omega_{\text{SCm}})^2/(2\Gamma^2)] (1 + [\text{SSq}]^n/26)$

### S204.2 Ramanujan 26-State Summation

Module	Purpose	Key Result
ramanujan_polylog_s26.py	Li_26([SSq]) via Euler-Ramanujan acceleration	15.7+ digits in 53 terms
s26_wstp_kernel.py	8-symbol Wolfram export (UQFFS26)	S26, R26, NaiveLi, S26VDS

**Core equation:**  $S_{26}(z) = \text{Li}_{26}(z) = \eta_{26}(z)/(1 - 2^{\{1-26\}}) + 2^{\{1-26\}}/(1 - 2^{\{1-26\}}) * \text{Li}_{26}(z^2)$

### S204.3 Mock Theta Functions (26-State)

Module	Purpose	Key Result
mock_theta_q26.py	f_26(q), phi_26(q), psi_26(q) q-series	Proper q-Pochhammer (a;q)_n

**Core equations:**

- $f_{26}(q) = \sum_{n=0}^{\{25\}} q^{\{n^2\}} / (-q; q)_{n^2}$
- $\phi_{26}(q) = \sum_{n=0}^{\{25\}} q^{\{n^2\}} / (-q^2; q^2)_n$
- $\psi_{26}(q) = \sum_{n=1}^{\{26\}} q^{\{n^2\}} / (q; q^2)_n$

### S204.4 Ramanujan 1/pi with UQFF Modification

Module	Purpose	Key Result
ramanujan_pi_uqff.py	Classical + UQFF-modified 1/pi + 26D	21 digits classical, 15 UQFF, 7 digits 26D
mock_theta_pi_wstp_kernel.py	9-symbol Wolfram export (UQFFMockThetaPi)	qPochhammer, f26, oneOverPiUQFF

**Core equation:**  $1/\pi = (2\sqrt{2}/9801) \sum R_n (1103 + 26390n) W_{26}(n) / C_{26}$   
 where  $W_{26}(n) = \prod_{i=1}^{\{26\}} [1 + [\text{SSq}] \exp(-\kappa_{\text{pai}} n/26)]$

### S204.5 Calibration Constants (Canonical)

Symbol	Value	Description
[SSq]	0.57	Universal Quantized Factor
kappa	$5.787 \times 10^{-9} \text{ s}^{-1}$	UQFF exponential decay rate
beta_i	0.603	Buoyancy coupling coefficient
H_ScM	0.99	ScM manifold completeness
rho_ScM	$7.09 \times 10^{-37} \text{ kg/m}^3$	ScM vacuum density
rho_UA	$7.09 \times 10^{-36} \text{ kg/m}^3$	UA aether vacuum density
omega_ScM	$2\pi \times 1.25 \text{ THz}$	ScM phonon resonance
sigma_0	$10^{-4}$	Base neutron cross-section

*Implementation: all modules operational in* CondensedPhysics.py, CondensedPhysics2.py, MAIN\_{1\CoAnQi}.cpp, and Wolfram kernels (uqff\_kozima\_kernel.wl, uqff\_s26\_kernel.wl, uqff\_mock\_theta\_pi\_kernel.wl).
