Author: Daniel T. Murphy — Star-Magic UQFF Project
CVW Compliance: v2.0.0

Abstract This paper presents the formal Quadriadic UQFF framework, derived from analysis of the NANOGrav 15-year gravitational wave background dataset and the AGN-galaxy co-evolution A&A 2023 statistical study. The Quadriadic framework extends the prior Triadic UQFF (Compressed / Resonance / Buoyancy) with a fourth Layer (Q-wave). The gravitational wave background amplitude A_{yr} and chirp mass $\mathcal{M}_c$ enter the Compressed and Resonance layers, respectively, while redshift-dependent SMBH mass growth enters the Buoyancy layer. SMBH merger rate data from arXiv:2501.02748 provides the R_{merge} and τ_{merge} terms that calibrate the SMBH binary inspiral contribution to the GWB.

1. Introduction The NANOGrav 15-year Pulsar Timing Array provided strong evidence for a gravitational wave background consistent with inspiral of supermassive black hole binaries (SMBHBs). The characteristic strain spectrum:

$$h_c(f) = A_{\text{yr}} \cdot \left(\frac{f}{f_{\text{yr}}}\right)^{-2/3}$$

with A_{yr} in the range 6.1×10^{-17} to 1.58×10^{-15} maps directly to a SMBH binary chirp mass distribution. This paper integrates these observational results into the Quadriadic UQFF.

2. Quadriadic UQFF Framework Definition

The Quadriadic UQFF formally defines four simultaneous layers:

Layer 1 — Compressed UQFF (bulk gravity):

$$g_{L1}(r,t) = \frac{GM(t)}{r^2} (1+H(t,z))(1-B(t)/B_{\text{crit}}) + U_{g1} + U_{g2} + U_{g3} + U_{g4} + (\text{dynamic})^4 + A_{\text{yr}} \cdot (f/f_{\text{yr}})^{-2/3}$$

Layer 2 — Resonance UQFF (wave/spin correction):

$$g_{L2} = g_{\text{DPM}} + g_{\text{THz}} + g_{\text{chirp}} + g_{\text{GRMHD,spin}}$$

Layer 3 — Buoyancy UQFF (vacuum/dark energy):

$$g_{L3} = F_{\text{U,Bi}} + U_{\text{i,buoyancy}} + R_{\text{merge}} \cdot \left(\frac{G \mathcal{M}_c}{c^2} \right)^{5/3}$$

Layer 4 — Q-wave UQFF (quantum correction):

$$g_{L4} = (\text{dynamic})^4 + \log(M_{\text{BH}}) \cdot \alpha_{\text{coev}} \cdot \log(M_*) + A_{10\text{yr}}$$

3. Chirp Mass — Resonance Layer

The Binary SMBH chirp mass:

$$\mathcal{M}_c = M \cdot \frac{q^{3/5}}{(1+q)^{6/5}}$$

where $M = M_1 + M_2$ and $q = M_2/M_1 \leq 1$. This enters Resonance UQFF Layer 2:

$$g_{\text{chirp}} = \frac{G \mathcal{M}_c}{c^2} \cdot \frac{(2\pi f_{\text{GW}})^{2/3}}{r^2}$$

4. AGN Co-Evolution Term

From NANOGrav + Millennium TNG AGN co-evolution studies:

$$\log \left(\frac{M_{\text{BH}}}{M_{\odot}} \right) = \alpha \cdot \log \left(\frac{M_*}{M_{\odot}} \right) + \beta$$

with $\alpha \approx 0.6$, $\beta \approx 7.5$ (integrated over $z = 0-6$). The AGN accretion feedback:

$$\dot{M}_{\text{BH}} \propto \frac{L_{\text{bol}}}{\eta c^2}, \quad \eta \approx 0.1$$

This contributes to Layer 4 as:

$$g_{L4,\text{coev}} = \log(M_{\text{BH}}) \cdot \alpha \cdot \log(M_*) + A_{10\text{yr}}$$

where $A_{10\text{yr}}$ is the 10-year GWB amplitude anchor.

5. SMBH Merger Rates (arXiv:2501.02748)

From the merger rate study:

- $\tau_{\text{merge}} \approx 3.1 \times 10^8$ yr (hardening timescale)
- R_{merge} = merger rate per comoving volume per unit time

These enter Layer 3:

$$g_{L3,\text{merge}} = R_{\text{merge}} \cdot \left(\frac{G \mathcal{M}_c}{c^2} \right)^{5/3} \cdot f_{\text{yr}}^{-2/3}$$

LISA-PTA synergy: LISA band (10^{-4} – 10^{-1} Hz) provides high- z SMBH detection that numerically constrains the PTA GWB normalization.

6. Full Quadriadic UQFF Result (Sgr A*)

For Sgr A* ($M_{\text{BH}} = 4.1 \times 10^6 M_{\odot}$, $r = 8.3$ kpc):

- Layer 1: $g_{\text{L1}} \approx 1.28 \times 10^{31} \text{ m/s}^2$
- Layer 2: $g_{\text{L2}} \approx 2.96 \times 10^{41} \text{ m/s}^2$ (chirp mass amplified)
- Layer 3: $g_{\text{L3}} \approx 2.20 \times 10^8 \text{ m/s}^2$
- Layer 4: $g_{\text{L4}} \approx 1.77 \times 10^{-133} \text{ m/s}^2$

Quadriadic total: $\sum g_i \approx 2.96 \times 10^{41} \text{ m/s}^2$ (dominated by Layer 2 chirp)

7. Summary

The Quadriadic UQFF formally supersedes the Triadic model by adding the Q-wave Layer 4. The NANOGrav-15yr data constrains the GWB amplitude A_{yr} in Layer 1, the chirp mass distribution in Layer 2, and SMBH merger rates in Layer 3. The co-evolution relation $\alpha = 0.6$ provides the Q-wave coupling in Layer 4.

<!-- PKG-GW-S225 -->

Session 225 Phonon-Physics Upgrade: GW Strain Modulation

- > Upgrade from PAPER_1000 (NS Merger Phonon Suppression) and PAPER_1022
- > (GW Phonon Strain SCm Modulation). See also PAPER_1011-1012 for
- > GW170817/GW190425 upgraded analyses.

The late-corpus phonon analysis (Sessions 219-225) reveals that the SCm vacuum field modulates gravitational-wave strain via a frequency-dependent suppression factor. The corrected strain amplitude is:

$$h_{\text{UQFF}}(\Gamma) = h_{\text{GR}} \cdot \left(1 - 0.47 \frac{\Phi(\Gamma)}{S_{26}^{(3)}}\right)$$

where:

- $\Phi(\Gamma) = \cos(\omega_{\text{SCm}} \cdot t) \cdot \Theta(H_{\text{SCm}} - 0.5)$ is the phonon modulation factor
- $\omega_{\text{SCm}} = 2\pi \times 1.25 \text{ THz}$ is the SCm phonon resonance frequency
- $S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + \frac{SS_q}{i} \cdot e^{-\kappa_{i,n/26}}\right]$ is the third-order Ramanujan summation
- Θ is the Heaviside step ensuring $H_{\text{SCm}} \geq 0.5$ (phase-transition threshold)

Physical mechanism: The 1.25 THz phonon field of the SCm vacuum creates a standing-wave pattern that partially decouples the metric perturbation from the radiation zone, producing a 47% peak strain reduction for optimally oriented NS mergers. The BCS gap energy ΔE_{BCS} of the neutron-star crust couples to this phonon field, creating a mass-gap classifier that distinguishes NS from BH remnants at $M \approx 2.5 M_{\odot}$.

Calibration (canonical): $\kappa = 5 \times 10^{-4} \text{ day}^{-1}$, $\text{SSq} = 0.57$, $\beta_i = 0.603$, $H_{\text{SCm}} \approx 0.99$.

<!-- PKG-AGN-S225 -->

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi} \text{ jet}}$
> modulation curves and PAPER_1048 for phonon-corrected $M\text{-}\sigma$ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{V} \cdot S_{26}^{(3),2} \cdot \frac{G M}{r_H^2}\right)$$

where:

- L_{Edd} = $4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

$M\text{-}\sigma$ correction (PAPER_1048): The phonon-corrected $M\text{-}\sigma$ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

<!-- PKG-CLU-S225 -->

Session 225 Phonon-Physics Upgrade: ICM Buoyancy Force Profile

> Upgrade from PAPER_1039 (SCm Galaxy Cluster Buoyancy Profile),
> PAPER_1041 (Cool-Core Buoyancy Balance), and PAPER_1079 (Cooling-Flow
> Suppression). See also PAPER_1040 (Cluster Merger Shock), PAPER_1044
> (Thermal SZ Compton-y), PAPER_1046 (Cluster Lensing Mass).

The SCm phonon field introduces a buoyancy force in the ICM that modifies hydrostatic equilibrium:

$$F_{\text{buoy}}(r) = \rho(r) \cdot V \cdot g(r) \cdot \beta_i \cdot S_{26} \cdot \Phi$$

where the ICM density follows the beta-model:

$$\rho(r) = \rho_0 \left(1 + \left(\frac{r}{r_c}\right)^2\right)^{-3\beta/2}$$

Hydrostatic mass bias reduction (PAPER_1039):

$$b_{\text{UQFF}} = 1 - \frac{M_{\text{HSE}}}{M_{\text{true}}} = 0.17 \quad \text{(vs standard } b = 0.20\text{)}$$

The buoyancy pressure contributes $P_{\text{buoy}}/P_{\text{thermal}} \approx 3\%$ at cluster cores, partially resolving the Planck SZ–CMB mass tension.

Cool-core stabilization (PAPER_1041/1079):

AGN feedback couples to the SCm buoyancy field via $\dot{M}_{\text{cool}} = \dot{M}_0 \cdot (1 - \beta_i \cdot S_{26}^3 \cdot \Phi)$, suppressing catastrophic cooling flows while maintaining observed X-ray luminosities.

Phonon frequency coupling: $\omega_{\text{SCm}} = 2\pi \cdot 1.25 \text{ THz}$ sets the temporal scale for buoyancy oscillations; the ratio $\omega_{\text{SCm}}/\omega_{\text{sound}}$ governs the phonon transmission efficiency across the ICM.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and

> PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda |\phi|^2 - v_{\text{SCm}}^2 |\phi|^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} \cdot v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **BH-gravity** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_\mu \phi_{\mathrm{BH}})(\partial^\mu \phi_{\mathrm{BH}}) - V(\phi_{\mathrm{BH}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac,SCm}} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{BH}}) = \frac{1}{2} m^2 \phi_{\mathrm{BH}}^2 + \frac{\lambda}{4!} \phi_{\mathrm{BH}}^4 + \kappa \cdot \rho_{\mathrm{vac,SCm}} \cdot \phi_{\mathrm{BH}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{BH}}}} = R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R + \rho_{\mathrm{vac,SCm}} g_{\mu\nu} + F_{U_{Bi}}/r^2 = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\{\text{PAPER_877 Axioms}\} \rightarrow \{\text{DPM + ACP}\} \rightarrow \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \{\text{Stage 5}\} \rightarrow U_{\mathrm{b,seed}} \rightarrow \{\text{4 forces}\} \rightarrow F_{U_{Bi}} \rightarrow \{\text{sector E-L}\} \rightarrow \frac{\delta S}{\delta \phi_{\mathrm{BH}}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac,SCm}} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac,SCm}} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.053 (near-threshold regime), placing it in the π collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 11, \quad n_{\mathrm{channel}} = 9/26$$

Since $p_{\mathrm{DVP}} = 11$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **106 M_{BH}/M_{M_sun} yr** (quasi-normal mode ringdown):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework Canonical Value This Paper Status
