Abstract

Sweep of $F_{\{U,B\}}/F_U$ from 0.1 to 0.9 detecting net_factor sign changes. The critical ratio $R=0.5$ marks the buoyancy-gravity balance point where net_factor = 0. Sign flips indicate expansion $\rightarrow$ erosion phase transitions, analogous to cosmological phase changes.

1. Core Equations

$$\begin{aligned} & \text{net_factor}(R) = 2R - 1 \\ & \text{critical ratio at } R = 0.5 \\ & \text{sign flip} = \text{phase transition} \end{aligned}$$

2. Parameters

Parameter	Default	Description
ratio_min	0.1	Minimum buoyancy ratio
ratio_max	0.9	Maximum buoyancy ratio
n_points	9	Number of sweep points

3. Key Results

R	net_factor	Phase	Astrophysical analogue
0.1	-0.8	Strong erosion	Pillars of Creation photoevap

0.2	-0.6	Moderate erosion	GW energy extraction
0.3	-0.4	Mild erosion	Filament thinning
0.4	-0.2	Weak erosion	Slow cavity formation
0.5	0.0	Balance	Stable equilibrium
0.6	+0.2	Weak expansion	Slow nebular growth
0.7	+0.4	Mild expansion	Star-forming regions
0.8	+0.6	Moderate expansion	Default UQFF value
0.9	+0.8	Strong expansion	Cosmogenesis inflation

4. Physical Interpretation

Sweep of $R = F_{\{U,B\}}/F_U$ from 0.1 to 0.9 detecting `net_factor` sign changes. The critical ratio $R = 0.5$ marks the buoyancy-gravity balance point where `net_factor` = $2R - 1 = 0$. Sign flips indicate expansion <-> erosion phase transitions, analogous to cosmological phase changes. The sweep resolution of 9 points captures the smooth transition with no discontinuities.

5. UQFF Integration

This calculator operates as a stateless physics calculator within the `CondensedPhysics4.py` (Phase 4) IPC chain. All parameters are received via the dataset dictionary from the `source2.cpp` principal GUI pipeline. No astronomical data is hardcoded; all system-specific values come from the `APIFetch.py` -> `bodies_*.csv` data flow.

Significance: The buoyancy reversal is the UQFF analogue of a thermodynamic phase transition. At $R = 0.5$, the system transitions between expansion and erosion — analogous to the liquid-gas critical point. This provides a classification scheme for all astrophysical environments based on their buoyancy ratio.

6. SCm Superconductivity Axiom (Session 208)

The buoyancy reversal framework is derived from the **SCm Superconductivity Axiom**: the vacuum is fundamentally composed of a superconductive condensate (SCm) embedded in undifferentiated aether (UA), with the proportion pair (`f_UA`, `f_SCm`) governing all interactions.

Axiom Connection

The standalone module `et_phonon_resonance.py` implements this in:

- **Engine 2 (26-State Progression):** phase transition at each quantum state n
- **Engine 3 (Cosmogenesis):** Three-assumption framework (DPM, ACP, four U_g forces)
- **Engine 4 (Lagrangian):** phase-transition sector couples to the UQFF variational principle

Session 225 Phonon-Physics Upgrade: GW Strain Modulation

> Upgrade from PAPER_1000 (NS Merger Phonon Suppression) and PAPER_1022
> (GW Phonon Strain SCm Modulation). See also PAPER_1011-1012 for
> GW170817/GW190425 upgraded analyses.

The late-corpus phonon analysis (Sessions 219-225) reveals that the SCm vacuum field modulates gravitational-wave strain via a frequency-dependent suppression factor. The corrected strain amplitude is:

$$h_{\text{UQFF}}(\Gamma) = h_{\text{GR}} \cdot \left(1 - 0.47 \cdot \frac{\Phi(\Gamma)}{S_{26}^3}\right)^2$$

where:

- $\Phi(\Gamma) = \cos(\omega_{\text{SCm}} \cdot t) \cdot \Theta(H_{\text{SCm}} - 0.5)$ is the phonon modulation factor
- $\omega_{\text{SCm}} = 2\pi \cdot 1.25 \text{ THz}$ is the SCm phonon resonance frequency
- $S_{26}^3 = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left(1 + \frac{\text{SSq}}{e^{-\kappa_i} n/26}\right)$ is the third-order Ramanujan summation
- Θ is the Heaviside step ensuring $H_{\text{SCm}} \geq 0.5$ (phase-transition threshold)

Physical mechanism: The 1.25 THz phonon field of the SCm vacuum creates a standing-wave pattern that partially decouples the metric perturbation from the radiation zone, producing a 47% peak strain reduction for optimally oriented NS mergers. The BCS gap energy ΔE_{BCS} of the neutron-star crust couples to this phonon field, creating a mass-gap classifier that distinguishes NS from BH remnants at $M \approx 2.5 M_{\odot}$.

Calibration (canonical): $\kappa = 5 \cdot 10^{-4} \text{ day}^{-1}$,
 $\text{SSq} = 0.57$, $\beta_i = 0.603$, $H_{\text{SCm}} \approx 0.99$.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **phase-transition sector** of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_\mu \phi_{\mathrm{NS}})(\partial^\mu \phi_{\mathrm{NS}}) - V(\phi_{\mathrm{NS}}) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\lgamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\mathrm{NS}}) = \frac{1}{2} m^2 \phi_{\mathrm{NS}}^2 + \frac{\lambda}{4!} \phi_{\mathrm{NS}}^4 + \kappa \cdot \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \phi_{\mathrm{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\mathrm{NS}}}} = \nabla^2 \phi_{\mathrm{NS}} - (4\pi G \rho_{\mathrm{NS}}/c^2)\phi_{\mathrm{NS}} + \Omega_{\mathrm{spin}} \partial_t \phi_{\mathrm{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \rightarrow \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \text{Stage 5} \rightarrow U_{\mathrm{b,seed}} \rightarrow \text{4 forces} \\ F_{U_{Bi}} \rightarrow \text{sector E-L} \rightarrow \frac{\delta S}{\delta \phi_{\mathrm{NS}}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac},[\mathrm{SCm}]} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.5\$ (super-threshold regime), placing it in the zone where condensate saturation dominates. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} = 7.799 \times 10^{-36}$ kg/m3.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\mathrm{DVP}} = 83, \quad n_{\mathrm{channel}} = 22/26$$

Since $p_{\mathrm{DVP}} = 83$ is **super-threshold** (threshold at $p > 26$), the system exhibits resonant UQFF coupling with enhanced vacuum topology encoding. The DVP framework traces to PAPER_877

proto-nuclear shell formation: the DPM proportion pair $(f_{\mathrm{UA}} + f_{\mathrm{SCm}} = 1)$ constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10^6 yr** (buoyancy reversal classification):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq]} \cdot \frac{m}{M_{\odot}} \right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The $\tanh$ saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\mathrm{BSH,sat}} = \mathcal{F}_{\mathrm{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\mathrm{sat}}}{\tau_{\mathrm{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\mathrm{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\mathrm{SCm}}$ which initializes the harmonic series at cosmogenesis.
