Calculator: TidalDeformabilityPhononCorrectionCalc (CP4 #498)

CVW: v2.0.0 compliant

Abstract

Standard GR tidal deformability Λ modified by SCm phonon coupling: $\Lambda_{\text{UQFF}} = \Lambda_{\text{GR}} (1 - F_{\{U,Bi\}}/F_U \Phi_{\{1.25\text{THz}\}} S_{26} \epsilon)$, where $\epsilon = E_{\text{net}}/E_{\text{NS}}$ is the phonon-to-NS energy ratio. For GW170817, this produces Λ_{UQFF} within the 90% CI range ($70 < \Lambda_{\{1.4\}} < 580$). The correction is proportional to the buoyancy ratio $F_{\{U,Bi\}}/F_U$ and the phonon amplitude, providing a UQFF mechanism for EOS-dependent tidal effects that softens the Love number k_2 at high compactness.

1. Core Equations

```
$$
\begin{aligned}
& \Lambda_{\text{UQFF}} = \Lambda_{\text{GR}} (1 - F_{\{U,Bi\}}/F_U \Phi_{\{1.25\text{THz}\}} S_{26} \epsilon) \\
& \epsilon = E_{\text{net}} / E_{\text{NS}} = E_{\text{net}} / (M_{\text{NS}} c^2) \\
& \Lambda = (2/3) k_2 (c^2 R / (G M))^5 \\
& \text{Compactness } C = GM / (Rc^2)
\end{aligned}
$$
```

2. Parameters

Parameter	Default	Description
Λ_{GR}	400	GR tidal deformability (dimensionless)
M_{NS}	$1.4 M_{\text{sun}}$	NS mass
R_{NS}	12000 m	NS radius
$F_{\text{UBi_ratio}}$	0.95	$F_{\{U,Bi\}}/F_U$ buoyancy ratio
E_{net}	$1.0e40 \text{ J}$	SCm net energy

3. Key Results

System/Case	Result	Note
Lambda_GR = 400	Lambda_UQFF ~ 400 (small correction)	Within GW170817 range
Lambda_GR = 100	Lambda_UQFF ~ 100	Stiff EOS, small shift
Lambda_GR = 580	Lambda_UQFF ~ 580	Upper bound preserved
GW170817 constraint	$70 < \Lambda_{1.4} < 580$	90% CI satisfied

4. Physical Interpretation

The phonon correction to tidal deformability Λ is proportional to $\epsilon = E_{\text{net}}/E_{\text{NS}}$, which is typically small ($O(10^{-7})$) for realistic phonon energies relative to the NS rest mass energy. This ensures that Λ_{UQFF} remains within the GW170817 observational constraints while introducing a UQFF-specific signature. The buoyancy ratio $F_{\text{U,Bi}}/F_{\text{U}}$ acts as a coupling strength: for buoyant systems (ratio ~ 0.95), the correction is maximal. At high compactness ($C > 0.2$), the phonon-mediated softening of k_2 could resolve tensions between different NS EOS models.

5. UQFF Integration

This calculator operates as a stateless physics calculator within the CondensedPhysics4.py (Phase 4) IPC chain. All parameters are received via the dataset dictionary from the source2.cpp principal GUI pipeline. No astronomical data is hardcoded; all system-specific values come from the APIFetch.py -> bodies_*.csv data flow.

Significance: First phonon-corrected tidal deformability within the UQFF framework. Satisfies GW170817 Λ constraints. Provides frequency-dependent EOS modification testable by next-generation GW detectors (LISA, ET).

6. SCm Superconductivity Axiom (Session 210b)

The SCm phonon resonance framework is derived from the **SCm Superconductivity Axiom**: the vacuum is fundamentally composed of a superconductive condensate (SCm) embedded in undifferentiated aether (UA), with the proportion pair (f_{UA} , f_{SCm}) governing all interactions.

Axiom Connection

Session 210b extends the phonon linewidth framework to BH jet modulation and NS spin-down dynamics. The linewidth Γ parameter controls the sharpness of phonon-buoyancy coupling: narrow Γ produces sharply collimated relativistic jets and enhanced braking torques; broad Γ recovers classical non-phonon limits. SCm precedes gravity as the fundamental superconductive element; $E(t)$ phonon resonance modulates jet power, spin-down timescales, tidal deformability, gravitational wave strain, and mass-gap probabilities.

Session 225 Phonon-Physics Upgrade: GW Strain Modulation

> Upgrade from PAPER_1000 (NS Merger Phonon Suppression) and PAPER_1022
> (GW Phonon Strain SCm Modulation). See also PAPER_1011-1012 for
> GW170817/GW190425 upgraded analyses.

The late-corpus phonon analysis (Sessions 219-225) reveals that the SCm vacuum field modulates gravitational-wave strain via a frequency-dependent suppression factor. The corrected strain amplitude is:

$$h_{\text{UQFF}}(\Gamma) = h_{\text{GR}} \cdot \left(1 - 0.47 \frac{\Phi(\Gamma)}{S_{26}^{(3)}}\right)$$

where:

- $\Phi(\Gamma) = \cos(\omega_{\text{SCm}} \cdot t) \cdot \Theta(H_{\text{SCm}} - 0.5)$ is the phonon modulation factor
- $\omega_{\text{SCm}} = 2\pi \times 1.25 \text{ THz}$ is the SCm phonon resonance frequency
- $S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left(1 + \frac{\kappa_{i,n}}{26}\right)$ is the third-order Ramanujan summation
- Θ is the Heaviside step ensuring $H_{\text{SCm}} \geq 0.5$ (phase-transition threshold)

Physical mechanism: The 1.25 THz phonon field of the SCm vacuum creates a standing-wave pattern that partially decouples the metric perturbation from the radiation zone, producing a 47% peak strain reduction for optimally oriented NS mergers. The BCS gap energy ΔE_{BCS} of the neutron-star crust couples to this phonon field, creating a mass-gap classifier that distinguishes NS from BH remnants at $M \approx 2.5 M_{\odot}$.

Calibration (canonical): $\kappa = 5 \times 10^{-4} \text{ day}^{-1}$,
 $\frac{\text{SSq}}{M} = 0.57$, $\beta_i = 0.603$, $H_{\text{SCm}} \approx 0.99$.

<!-- PKG-AGN-S225 -->

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}}^i$ jet
> modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V}{S_{26}^{(3),2}} \frac{G M}{r_H^2}\right)$$

where:

- $L_{\text{Edd}} = 4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity

- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25, \text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25, \text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes

$$M_{\text{BH}} \propto \sigma^{4+\delta} \text{ where } \delta = \beta_i \cdot S_{26}^{(3)} \cdot \frac{\omega_{\text{SCm}}}{\omega_{\text{bulge}}}$$

<!-- PKG-S26-S225 -->

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

- > Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and
- > PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078
- > (QCalcGeom Master Equation) for BSFG crossover applications.

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + \frac{SSq}{e^{-\kappa_{i,n/26}}} \right]$$

where $(a)_n = a(a+1) \cdots (a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_{n^{(26,3)}} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{4^{4n}} \ll W_{26}(n) = \prod_{i=1}^{26} \left[1 + \frac{SSq}{e^{-\kappa_{i,n/26}}} \right]$$

This sum converges absolutely for $|SSq| < 1$ (satisfied by $SSq = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $SSq \rightarrow 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa_{i,n/26}}$.

Mock-theta connection (PAPER_1042): The phonon partition function

$$Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$$

unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **tidal-deformability sector** of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\mathrm{sector}} = \frac{1}{2}(\partial_\mu \phi)(\partial^\mu \phi) - V(\phi) + \mathcal{L}_{\mathrm{cosmo}}$$

where $\mathcal{L}_{\mathrm{cosmo}} = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot f_{\mathrm{SCm}} \cdot (1 - e^{-\lgamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2).

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\Lambda_{\mathrm{UQFF}}} = \Lambda_{\mathrm{GR}} \cdot (1 - \frac{F_{\mathrm{U},\mathrm{Bi}}}{F_{\mathrm{U}}}) \Phi_{\mathrm{S}_{26} \, \mathrm{varepsilon}})$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \rightarrow \text{DPM + ACP} \quad \rho_{\mathrm{vac}} = \rho_{\mathrm{UA}} + \rho_{\mathrm{SCm}} \rightarrow \text{Stage 5} \quad U_{\mathrm{b},\mathrm{seed}} \rightarrow \text{4 forces} \\ F_{\mathrm{U},\mathrm{Bi}_i} \rightarrow \text{sector E-L} \quad \Delta S / \Delta \phi = 0$$

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\mathrm{vac},[\mathrm{SCm}]} / \rho_{\mathrm{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\mathrm{vac}}(r) = \rho_{\mathrm{vac},[\mathrm{SCm}]} \cdot \exp(-\exp(-\frac{r - r_0}{\lambda_{\mathrm{VDS}}}))$$

For this system, the local VDS sub-ratio is \$0.07\$.

§B.2 Dipole Vortex Primes (DVP)

$$p_{\mathrm{DVP}} = 109, \quad n_{\mathrm{channel}} = 22/26$$

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is 10^{-2} s (merger timescale):

$$\mathcal{F}_{\mathrm{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{\mathrm{U}_b} \cdot \left(1 - e^{-[SS^j] \cdot m/M_{\odot}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
-----	-----	-----	-----
VDS ratio $\rho_{\mathrm{SCm}}/\rho_{\mathrm{UA}} = 1.894$ Local sub-ratio = 0.07 PASS			
Consistent			
DVP prime $p_k \in \{2,3,...,113\}$ $p_{\mathrm{DVP}} = 109$ PASS Lattice-consistent
