Abstract

We derive the ergosphere phonon resonance conditions for BL Lac and Mrk 421 type blazars within the UQFF framework. The key result is that SCm phonon modes, when Doppler-boosted by relativistic bulk Lorentz factors $\Gamma_{\text{bulk}} \sim 15$, satisfy the superradiant condition $\omega_{\text{obs}} < \Omega_{\text{H}}$ for spinning black holes with $a \geq 0.95$. The extracted ergosphere energy couples to the 26-layer gravity framework via $E_{\text{ergo}} = (a/2) M c^2 S_{26}^2 \delta_D$.

1. Core Equations

Doppler factor:

$$\delta_D = \frac{1}{\Gamma_{\text{bulk}} (1 - \beta \cos \theta_{\text{obs}})}$$

where $\beta = \sqrt{1 - 1/\Gamma_{\text{bulk}}^2}$.

Horizon angular velocity:

$$\Omega_{\text{H}} = \frac{a \cdot c}{2 r_{\text{H}}}$$

where $r_{\text{H}} = \frac{r_{\text{S}}}{2} (1 + \sqrt{1 - a^2})$ and $r_{\text{S}} = 2GM/c^2$.

Superradiant condition:

$$\omega_{\text{obs}} = \omega_{\text{SCm}} \cdot \delta_D < \Omega_{\text{H}}$$

Ergosphere phonon energy:

$$E_{\text{ergo}} = \frac{a}{2} M c^2 \cdot S_{26}^2 \cdot \delta_D$$

2. UQFF Integration

The `BlazarErgospherePhononResonanceCalc` (CP4 #516) computes δ_D , ω_{obs} , Ω_{H} , the superradiant flag, and E_{ergo} for arbitrary blazar parameters. The `simulate()` method sweeps over

Gamma_bulk = [5, 10, 15, 20, 30] to map the transition into and out of the superradiant regime.

3. Physical Significance

Blazar jets are among the most powerful persistent energy sources in the universe. The Blandford-Znajek mechanism extracts rotational energy from the ergosphere via magnetic field threading. The UQFF contribution is a phonon-mediated channel: SCm lattice modes in the vacuum near the horizon are Doppler-shifted into the superradiant band, enabling additional energy extraction that modulates the observed jet power.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U,Bi,i}$ jet
> modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3),2}}{G M / r_H^2}\right)$$

where:

- $L_{\text{Edd}} = 4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25\text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25\text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M– σ correction (PAPER_1048): The phonon-corrected M– σ relation becomes

$$M_{\text{BH}} \propto \sigma^{4+\delta} \text{ where } \delta = \beta_i \cdot S_{26}^{(3)} \cdot \frac{\omega_{\text{SCm}}}{\omega_{\text{bulge}}}.$$

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

> Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and

> PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078

> (QCalcGeom Master Equation) for BSFG crossover applications.

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + \frac{\text{SSq}}{e^{-\kappa_i, n/26}}\right]$$

where $(a)_n = a(a+1) \cdots (a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \ll W_{26}(n) = \prod_{i=1}^{26} \left[1 + \frac{\text{SSq}}{e^{-\kappa_i, n/26}}\right]$$

This sum converges absolutely for $|\text{SSq}| < 1$ (satisfied by $|\text{SSq}| = 0.57$)

and reduces to the classical Ramanujan $1/\pi$ series when $|\text{SSq}| \rightarrow 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa_i, n/26}$.

Mock-theta connection (PAPER_1042): The phonon partition function

$$Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$$

unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

Calibration Constants

Constant	Symbol	Value	Validation Domain
UQFF damping rate	κ	$5.0 \times 10^{-4} \text{ day}^{-1}$	Magnetar spin-down
String sector coupling	SSq	0.57	BH dynamics
Buoyancy coupling	β_i	0.603	Multi-system
