Abstract

We derive the E(t) linewidth modulation function with sign-flip dynamics for astrophysical jets. The time-domain response $E(t, \Gamma) = S_{26} \cdot \cos(\omega_{\text{SCm}} t) \cdot \exp(-\Gamma t)$ exhibits sign flips at $t_{\text{flip}} = \pi/(2\omega_{\text{SCm}})$, driving extra-gravitational responses in blazar jets. Narrow linewidths produce sharper sign flips with tighter jet collimation; broad linewidths damp the oscillation before the first flip.

1. E(t) Function

$$E(t, \Gamma) = S_{26} \cdot \cos(\omega_{\text{SCm}} t) \cdot \exp(-\Gamma t)$$

2. Sign-Flip Time

$$t_{\text{flip}} = \frac{\pi}{2\omega_{\text{SCm}}} \approx 0.064 \text{ ps}$$

3. Regime Dependence

Γ (THz)	Flips in 5 ps	Jet Behavior
0.01	Many	Ultra-tight collimation
0.10	Several	Optimal modulation
1.00	Few/None	Damped, diffuse wind

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi}}$ jet
> modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{\rho_{\text{H}}} \cdot V \cdot S_{26}^{(3),2} \cdot \frac{G}{r_H^2}\right)$$

where:

- L_{Edd} is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25, \text{THz}} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25, \text{THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M - σ correction (PAPER_1048): The phonon-corrected M - σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot \frac{\omega_{\text{SCm}}}{\omega_{\text{bulge}}}$.

Calibration Constants

Constant	Symbol	Value	Validation Domain
κ	—	$5.0 \times 10^{-4} \text{ day}^{-1}$	Magnetar spin-down
S_{sq}	—	0.57	String coupling
ω_{SCm}	—	$2\pi \times 1.25 \text{ THz}$	Phonon resonance
t_{flip}		$\pi/(2\omega_{\text{SCm}}) \approx 0.064 \text{ ps}$	Sign-flip time

SM Anchor — CVW v2.0.0
