

Centaurus A AGN F_U_Bi_i Curves — 7-Point Gamma Sweep with Jet Modulation

Daniel T. Murphy

PAPER_991: Centaurus A AGN F_U_Bi_i Curves

Abstract

We compute numerical F_{U,Bi_i} curves for Centaurus A ($M_{\text{BH}} = 5.5 \times 10^7 M_\odot$, $a = 0.70$, $B = 3000 \text{ G}$) across 7 linewidth values $\Gamma \in \{0.01, 0.05, 0.1, 0.5, 1.0, 5.0, 10.0\} \text{ THz}$.

1. Jet Modulation Factor

$$M_{\text{jet}}(\Gamma) = 1 + A_{\text{jet}} \cdot \exp\left(-\frac{\Gamma}{\Gamma_0}\right)^{2\sigma_\Gamma}$$

with $A_{\text{jet}} = 1.5$, $\Gamma_0 = 2\pi \times 0.1 \text{ THz}$, $\sigma_\Gamma = 0.08 \times 2\pi \text{ THz}$.

2. Jet Power

$$P_{\text{jet}}(\Gamma) = \frac{B^2}{8\pi} \left(\frac{r_H}{c}\right)^2 a^2 c \cdot M_{\text{jet}}(\Gamma)$$

3. Combined F_U_Bi_i at Horizon

$$F_{U,\text{Bi}_i}^{\text{CenA}}(\Gamma) = U_g(r_H) - U_b(r_H) + P_{\text{jet}}(\Gamma) \times 10^{-45}$$

The jet power coupling at 10^{-45} ensures dimensional consistency with the acceleration-scale $F_{U_Bi_i}$.

4. Implementation

File: fubi_inside_outside.py, class CentaurusAFUBiCurves. CP4 class #575.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

> Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037
> (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_Bi_i}$ jet
> modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}}}{r_H^2} V\right) S_{26}^{(3),2} G M$$

where:

- L_{Edd} = $4\pi G M m_p c / \sigma_T$ is the classical Eddington luminosity
- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density
- V is the effective buoyancy volume (accretion sphere)
- $S_{26}^{(3),2}$ is the squared third-order Ramanujan factor (quadratic coupling)
- r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \Phi_{1.25} \text{THz} \cdot \left(\frac{B}{B_{\text{crit}}}\right)^2\right]$$

where $\Phi_{1.25} \text{THz} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M– σ correction (PAPER_1048): The phonon-corrected M– σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

> Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and
> PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2} (\partial_\mu \phi)^2 - \lambda |\phi|^2 - v_{\text{SCm}}^2 |\phi|^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

| Sector | Domain | Late-Corpus Result |

|-----|-----|-----|

- | | | |
|------------|--------------------------|---|
| 1 (EH) | General Relativity | Canonical Einstein-Hilbert |
| 2 (YM) | Yang-Mills gauge | $m_{\text{gap}} = 1.736 \text{ GeV}$ (PAPER_1318) |
| 3 (Dirac) | Fermion / LENR | Kozima neutron-drop (PAPER_1061) |
| 4 (SCm) | Superconducting manifold | $V(\phi_0) = -\rho_{\text{SCm}}$ canonical |
| 5 (Mag) | Um magnetism | Heaviside amplifier (PAPER_1072) |
