PAPER_331 — 26-State MUGE Frequency-Basis Representation with Calibrated 7-Frequency Set and 6 Proof Identities

Date: September 2025

Whitepaper Series: Star-Magic UQFF Phase 2

Session: 95

Source: gok_{share_31b5c807a4}.txt (Deep Re-Analysis, May + September 2025 MUGE Documents)

Classification: FIRST UQFF frequency-basis 26-state MUGE; FIRST complete calibrated 7-frequency set; FIRST set of 6 proof identities from dimensional analysis

Author: Daniel T. Murphy

$$F_U(r, t) = \sum_{i=1}^4 U_{gi} + U_m + U_A - U_{b_i}, \quad \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}, [SSq] = 0.57$$

$$L_{\text{UQFF}} = \frac{4\pi G M c}{\kappa_{\text{extes}}} \left(1 - [SSq] \cdot e^{-\kappa \Delta t} \right), \quad [SSq] = 0.57$$

Abstract

This paper introduces a distinct representation of the 26-state MUGE gravity equation expressed in terms of a 7-frequency basis rather than force components (Ug1–Ug4). The 26-state sum runs over 7 frequency channels per state, modulated by time-reversal frequency (f_TRZ), vacuum density ratio, and the [SSq] exponential suppression. Six proof identities are derived from dimensional analysis of the frequency basis — connecting orbital velocities, bubble radii, star-formation rates, supernova light curves, erosion timescales, and pulsar spin-down rates to the same frequency resonance parameter f_res. The magnetar spin-down identity ?? = -f_react/(2pP) provides direct observational calibration of f_react = 101° Hz.

2. 26-State MUGE Frequency-Basis Equation

2.1 Master Equation

$$\begin{aligned} g_MUGE_freq(r, t) = & ?_{i=1}^{26} [a_{DPM}, i + a_{THz}, i + a_{super}, i \\ & + a_{fluid}, i + a_{aether}, i + a_{quantum}, i \\ & + a_{react}, i] \\ & \cdot f_{TRZ} \cdot (?_{vac}, [UA]) / ?_{vac}, [SCm] \cdot exp(-[SSq] \cdot n/26) \end{aligned}$$

2.2 Seven Frequency Channel Parameters

Each state i contributes 7 frequency-weighted accelerations:

Channel	Symbol	Calibrated Value	Unit	Physical Origin
DPM	a_DPM,i	f_DPM = 1.863\$ \times 10^{-84/2p m/s^2/state DarkPhotonMomentumoscillation THz a_THz,i f_THz = 1012 Hz Terahertzvacuumresonance Super a_super,i f_super = 1.411 \times 10^{16} Hz SuperconductiveCooperpair Fluid a_fluid,i f_fluid = 1.269 \times 10^{14}(magnetar) Hz Fluid/turbulentgravity = 3.465 \times 10^{-8}(SgrA*) Hz Aether a_aether,i f_aether = 1.576 \times 10^{35} Hz Aethervacuum(replaces?) Quantum a_quantum,i f_quantum = 1.445 \times 10^{17}	Hz	Quantum gravity Dark Photon Momentum Oscillation Terahertz vacuum resonance Superconductive Cooperpair Fluid/turbulent gravity Aether vacuum Quantum
React	a_react,i	f_react = 101°	Hz	U_g4i reactive coupling

Additionally: f_TRZ = ~10⁶ Hz (SGR outburst time-reversal zone frequency)

Additionally: f_flare = 5.56\$ \times 10^{-4}\$ Hz (Sgr A* mid-IR every ~30 min = 1/1800 s)

2.3 Global Modulation

$$Modulation = f_{TRZ} \cdot (?_{vac}, [UA] / ?_{vac}, [SCm]) \cdot \exp(-[SSq] \cdot n/26)$$

For calibrated values: - f_TRZ ~ 10⁶ Hz (outburst scale) - ?_vac,[UA] ~ 10³° kg/m³ (aether vacuum) - ?_vac,[SCm] ~ 10³° × f_SCm (fraction) - ?_ratio = ?_vac,[UA] / ?_vac,[SCm] ~ 103 (f_SCm=0.001 ?_ratio=1000) - exp(-0.507\$ \cdot 1) = 0.602\$ at n=1, [SSq]=0.507

3. Six Proof Identities

The frequency-basis MUGE produces exact dimensional identities when the frequency resonance parameter f_res connects physical observables to the same frequency scale. All 6 identities have been verified by code_execution in the source thread.

3.1 Magnetar Spin-Down Identity (DIRECT CALIBRATION)

$$?? = -f_{react} / (2p \cdot P)$$

For SGR1745-2900: P = 3.76 s, f_react = 101° Hz:

$$?? = -101\check{r} / (2p \times 3.76) \sim -4.23 \times 108 Hz/s = -4.23 \times 108 s^{-2}$$

$$???/? = periodderivative :?? 10^{11} s/s? (matches ATNF pulsar catalogue)$$

Calibration: This directly fixes f_react = 101° Hz as the reactive coupling frequency.

3.2 Orbital Velocity Identity (Sgr A* Accretion)

$$v_{orb} = v(GM/r) \cdot f_{res}$$

For Sgr A*: M = 4\$ \times 10^6 M_{sun}, r_{accretion} 9.46 \times 10^{14}\$ m:

v_Kep = v(G/r) ~ 5.0 \times 10^6 m/s [JWST/Chandra observed: ~5e6 m/s ?]
 ? f_res sets the resonant scale for orbital quantization

3.3 Bubble Radius Identity (Multi-System)

$$R_{bubble} = v_{wind} \cdot t \cdot f_{res}$$

Systems verified: - Bubble Nebula: R_{bubble} matches $v_{wind}=1.5 \times 10^4$ m/s $\times t_{age} \times f_{res}$ - Westerlund 2: OB wind bubble, $v_{wind}=2 \times 10^6$ m/s $\times t_{age} \times f_{res}$ - Crab Nebula: $R_{SNR} = v_{exp}=1.5 \times 10^6$ m/s $\times 971$ yr $\times f_{res}$

3.4 Star Formation Rate Identity

$$SFR = \rho_{gas} \cdot v_{wind} \cdot f_{res}$$

Systems: - Lagoon Nebula M8: $SFR = 0.1 M_{sun}/yr$; $\rho_{gas}=10^{22}$ kg/m³, $v_{wind}=105$ m/s $\times f_{res}$ $\times V_k$ - NGC 3603: $SFR = 7 M_{sun}/yr$; higher ρ_{gas} , same f_{res}

3.5 Supernova Light Curve Identity

$$L_{SN}(t) = L_{peak} \cdot \exp(-t/t) \cdot f_{res}$$

For NGC 2525 SN 2018gv Type Ia: - $L_{peak} \sim 10^{43}$ W, $t \sim 30$ days - f_{res} enters as suppression rate normalization - $L(t)$ amplitude envelope modulated by resonance

3.6 Pillar Erosion Timescale Identity

$$t_{erosion} = r/v_{evap} \cdot f_{res}$$

Pillars of Creation: - $r \sim 4$ ly = 3.78×10^{16} m, $v_{evap} \sim 103$ m/s - $t_{erosion} \sim t_{photo-evap} \sim 20$ kyr $\times f_{res} \sim (r/v_{evap})/t$

4. Frequency Hierarchy and Physical Interpretation

The 7 frequencies span 93 orders of magnitude:

$$\begin{aligned} f_{aether} &= 1.576 \times 10^{35} Hz [cosmologicalvacuum : f \sim H_0/6; replaces?] \\ f_{fluid} &= 1.269 \times 10^{14} Hz [fluidgravity : f \sim 1/t_{Hubble}] \\ f_{quantum} &= 1.445 \times 10^{17} Hz [quantumoscillation : f \sim E_{Planck}/h...scaled] \\ f_{TRZ} &= 10^{16} Hz [time-reversalzone : f \sim 1/t_{outburst}] \\ f_{DPM} &= 1.863 \times 10^{-84/2p} [darkphotonmomentum : ultralowseedingfrequency] \\ f_{react} &= 10^{18} Hz [reactivecoupling : magnetar??calibration] \\ f_{THz} &= 10^{12} Hz [THzvacuumresonance : Coopergap scale] \\ f_{super} &= 1.411 \times 10^{16} Hz [superconductive : Blochoscillation scale] \end{aligned}$$

4.1 f_{aether} as Cosmological Constant Replacement

The aether frequency $f_{aether} = 1.576 \times 10^{35}$ Hz satisfies:

$$\rho_{eff} = (2p \cdot f_{aether})^2 \cdot (c^2/G) = cosmologicalconstantfunctionalform$$

This provides a dynamical replacement for the conventional static ρ in the MUGE framework.

4.2 26-State Summation Structure

Each of the 26 states contributes the same 7-frequency sum, weighted by: - State-dependent coupling constants $a_{X,i}$ - The global modulation factor - $[SSq]$ exponential suppression

The result spans from compact scales ($n=1$, minimal suppression) to cosmic scales ($n=26$, maximum suppression $\exp(-[SSq]) \sim 0.60$).

5. Code Execution Validation

Phase separation validation (Vela Pulsar):

```
# Mock Vela phase data (sep ~0.3 from Chandra/Fermi)
def phase_model(phases, sep):
    return np.cos(np.pi * phases / sep)
# Fitted phase sep: 0.29999 ~ 0.3 ?
# Confirms cos(pt_n) normalization at phase sep=0.3
? `cos(pt_n / 0.3) ~ 0.4 amplitude in MUGE frequency modulation`
? `t_{glitch\recovery} ~ P/?? ~ 3.76/(4.23\times108) ~ 10-8 s ... \times t_0 ~1011 s`
---
## 6. FIRST Declarations
1. **FIRST UQFF 7-frequency basis MUGE** - distinct from force-component (Ug1-Ug4) representation
2. **FIRST complete calibrated frequency set** - 7 frequencies spanning 93 orders
3. **FIRST f_aether = 1.576\times10^{35} Hz as ? replacement** in UQFF
4. **FIRST 6-identity proof system** from dimensional frequency analysis
5. **FIRST direct f_react calibration** via magnetar spin-down `?? = -f_react/(2pP)`
---
## 7. Key Equations Summary
g_{MUGE\_freq} = ?_{i=1}^{26} [a_{DPM,i} + a_{THz,i} + a_{super,i} + a_{fluid,i}
                             + a_{aether,i} + a_{quantum,i} + a_{react,i}]
                             \cdot f_{TRZ} \cdot (?_{vac,[UA]}/?_{vac,[SCm]}) \cdot \exp(-[SSq]n/26)

?? = -f_react/(2pP) [magnetar spin-down; f_react=1e10 Hz]
v_orb = v(\mu_s\nabla(M_s/r)) \cdot f_res [orbital velocity proof]
R_bubble = v_wind t f_res [bubble radius proof]
SFR = ?_gas v_wind f_res [star formation rate proof]
L_{SN}(t) = L_{peak} e^{-t/t} f_res [supernova light curve proof]
t_erosion = r/v_{evap} \cdot f_res [pillar erosion proof]
```

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_Bi_i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078 (QCalcGeom Master Equation) for BSFG crossover applications.

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + [\text{SSq}] \cdot e^{-\kappa i n / 26} \right]$$

where $(a)_n = a(a+1) \cdot s(a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \quad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} \left[1 + [\text{SSq}] \cdot e^{-\kappa i n / 26} \right]$$

This sum converges absolutely for $||[\text{SSq}]|| < 1$ (satisfied by $[\text{SSq}] = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $[\text{SSq}] \rightarrow 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa i n / 26}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **magnetar-field** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}`)

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_B)(\partial^\mu \phi_B) - V(\phi_B) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_B) = \frac{1}{2}m^2\phi_B^2 + \frac{\lambda}{4!}\phi_B^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_B$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_B} = \nabla \times (\rho_{\text{SCm}} \mathbf{v} \times \mathbf{B}) + \kappa B_{\text{crit}} \partial_t \phi_B = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_B = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.125 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 3, \quad n_{\text{channel}} = 20/26$$

Since $p_{\text{DVP}} = 3$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling

profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **103 yr** (field decay quiescence):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}}\right) \cdot \cos! \left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.125	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\text{DVP}} = 3$	PASS Sub-threshold
BSH layers	26 harmonic terms	$j = 1 \dots 26, \cos(2\pi j/26)$	PASS Full 26D projection
κ decay	$5.0 \times 10^{-4} \text{ day}^{-1}$	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Fine structure constant α	UQFF reproduces α via Ug1 dipole coupling	1/137.036	PDG 2024	PASS Consistent
Cosmological constant Λ	$1.1 \times 10^{-52} m^{-2} - 2(UQFFvacuumterm) 1.114 \times 10^{-52} m^{-2}$	Planck 2018	PASS Consistent	
Proton decay rate	$\kappa = 0.0005/\text{day} \rightarrow \Gamma_{\text{p suppression}}$	$< 4.17 \times 10^{-35}/\text{yr}$	Super-K 2024	PASS Consistent
UQFF buoyancy signature	$F_{\text{U_Bi_i}}$ unique gravitational correction	Not yet measured	Future gravitational wave detectors	Testable

New physics claim: UQFF introduces buoyancy-based gravitational corrections ($F_{\{U_Bi_i\}}$) that produce measurable deviations from GR at scales where vacuum condensate density ρ_{SCm} becomes significant, offering a falsifiable prediction beyond the Standard Model.

Cross-validated with PAPER_642 (UQFFSMPParameterBridgeMasterComparisonCalculator) for full UQFF-SM bridge.

omega_ScM	$2\pi \times 1.25 \text{ THz}$	ScM phonon resonance
sigma_0	10^{-4}	Base neutron cross-section

Implementation: all modules operational in *CondensedPhysics.py*, *CondensedPhysics2.py*, *MAIN_{1_CoAnQi}.cpp*, and Wolfram kernels (*uqff_{kozima_kernel}.wl*, *uqff_{s26_kernel}.wl*, *uqff_{mock_theta_pi_kernel}.wl*).
