Classification: FIRST 10-term resonance acceleration suite in UQFF; FIRST side-by-side getSolutions(t) comparison for all 7 canonical SOURCE4 systems

Author: Daniel T. Murphy

CP4 Class: MUGEFinal7SystemResonanceAccelerationsCalculator (#96, PAPER_458)

Abstract

The MUGE Final 7-System module applies the complete 10-term resonance acceleration suite to the 7 canonical SOURCE4 astrophysical systems (SGR1745 magnetar, Sagittarius A*, Tapestry starbirth, Westerlund 2, Pillars of Creation, Rings of Relativity, and Student Guide Universe). Each of the 10 resonance terms is individually evaluated and summed for each system. The method `getSolutions(t)` returns side-by-side output from all 7 systems simultaneously, enabling direct comparison of how each resonance mechanism contributes differently across object classes. The 10-term suite introduces the `Osc_term` (standing-wave oscillation) and `aExpFreq` (expansion-frequency coupling) for the first time.

2. The 10-Term Resonance Acceleration Suite – PAPER_458

2.1 Term Listing

#	Term	Symbol	Formula
1	THz hole coupling	<code>a_THz</code>	$c^3 / (GMr) \times f_{\text{THz}2}$
2	Vacuum differential	<code>a_{vac_diff}</code>	$\rho_{\text{vac}, [\text{SCm}]} \times V^{(1/3)} - \rho_{\text{vac}, [\text{UA}]} \times V^{(1/3)}$
3	Super-frequency	<code>a_SuperFreq</code>	$\Sigma A_k \sin(2\pi f_k t), k=1..5$
4	Aether resonance	<code>a_AetherRes</code>	$\rho_{\text{vac}, \text{SCm}} V_{\text{sys}}^{(1/3)}$
5	Ug4 vacuum	<code>Ug4_i</code>	$U_A \rho_{\text{vac}} (1 + [\text{UA}][\text{SCm}])$
6	Quantum frequency	<code>a_QuantumFreq</code>	$\omega_q / (M c^2 r) \times c$
7	Aether frequency	<code>a_AetherFreq</code>	$f_{\text{aether}} \times r \times [\text{SCm}]$
8	Fluid frequency	<code>a_FluidFreq</code>	$\nu_{\text{fluid}} \times f_{\text{fluid}2} \times r$
9	Oscillation standing wave	<code>Osc_term</code>	$A_{\text{osc}} \cos(k_{\text{osc}} r) \sin(\omega_{\text{osc}} t)$

#	Term	Symbol	Formula
10	Expansion frequency	a_ExpFreq	$H_0 \times c \times \sin(2\pi H_0 t)$

2.2 New Terms: Osc_term and a_ExpFreq

Osc_term – Standing wave oscillation (FIRST in UQFF):

$$\text{Osc_term}(r, t) = A_{\text{osc}} \cos(k_{\text{osc}} r) \sin(\omega_{\text{osc}} t)$$

With A_{osc} = system-dependent amplitude, $k_{\text{osc}} = 2\pi/r_{\text{char}}$, $\omega_{\text{osc}} = 2\pi f_{\text{char}}$.

The **Osc_term** represents **gravitational standing waves** in the system’s characteristic cavity – analogous to the Schumann resonance for electromagnetic standing waves in the Earth-ionosphere cavity, but applied to the gravitational field.

a_ExpFreq – Expansion-frequency coupling (FIRST in UQFF):

$$a_{\text{ExpFreq}}(t) = H_0 \cdot c \cdot \sin(2\pi H_0 t)$$

$$= 2.27 \times 10^{-18} \times 3 \times 10^8 \times \sin(2\pi \times 2.27 \times 10^{-18} t)$$

$$= 6.81 \times 10^{-10} \sin(1.427 \times 10^{-17} t) \text{ m/s}^2$$

Period: $T_{\text{ExpFreq}} = 1/H_0 = 4.41 \times 10^{17} \text{ s} = 13.97 \text{ Gyr}$ (Hubble time). This term **oscillates at the Hubble period** – encoding cosmic expansion as a sinusoidal gravity modulation. At present epoch ($t = t_H$), $a_{\text{ExpFreq}} = 6.81 \times 10^{-10} \sin(2\pi) = 0$ – confirming the term is zero at the current Hubble time, not creating a net present-day bias.

3. Full Resonance Equation

$$g_{\text{res}}^{(j)}(r, t) = g_{mDPM}^{(j)}(1 + H_z t)(1 - B/B_{\text{crit}}) + \sum_{i=1}^{10} a_i^{(j)}(r, t)$$

4. getSolutions(t) Results for 7 Canonical Systems

At $t = 1 \text{ Gyr} = 3.156 \times 10^{16} \text{ s}$:

4.1 SGR 1745-2900 Magnetar

Term	Value (m/s ²)
g_DPM	$3.716 \times 10^{12} a_T H_z 7.26 \times 10^{24} a_{\text{AetherRes}} 4.9 \times 10^6 Osc_term 1 3(oscillatory) a_{\text{ExpFreq}} - 6.81 \times 10^{-10} \sin(1.427) \approx 4.1 \times 10^{-10} g_{\text{restotal}} \approx 3.73 \times 10^6$ (after UQFF coupling factors)

4.2 Sagittarius A*

Term	Value (m/s ²)
g_DPM	$\sim 6.25 \times 10^1 a_{AetherFreq} 1 \times 10^{-2} a_{FluidFreq} 10^{-15} a_{ExpFreq} 4.1 \times 10^{-10}$
g_res total	~ 1.52

4.3 Tapestry Starbirth

Term	Value (m/s ²)
g_DPM	$\sim 2.65 \times 10^{-12} P_{outflow} 10^{-10} Osc_{term} 10^{-13} *g_{restotal} * * 1.02 \times 10^{-10}$

4.4 Universe Guide

Term	Value (m/s ²)
g_DPM	$\sim 5.88 \times 10^{-10} g_{DM} 1.58 \times 10^{-10} a_{ExpFreq} 4.1 \times 10^{-10} *g_{restotal} * * 1.14 \times 10^{-9}$

5. Term Hierarchy Across 7 Systems

Term	Magnetar	SgrA*	Tapestry	Universe
a_THz	dominant	small	tiny	tiny
a_AetherRes	large	medium	small	small
a_ExpFreq	tiny	tiny	tiny	non-negligible
Osc_term	medium	small	medium	small
a_{vac_diff}	small	small	small	negligible

Key result: a_THz dominates for compact objects (magnetar), while a_ExpFreq becomes non-negligible only for cosmological systems.

6. Standard Model Comparison

Feature	SM	UQFF PAPER_458
Resonance terms in gravity	None	10-term acceleration suite
Hubble oscillation	Not in gravity	$a_{ExpFreq} = H_0 c \sin(2\pi H_0 t)$
Standing-wave gravity	Not in gravity	$Osc_{term} = A \cos(k r) \sin(\omega t)$
Multi-system side-by-side	Separate codes	getSolutions(t) for all 7

7. Testable Predictions

- a_ExpFreq period = Hubble time:** At $t=t_H$, $a_{ExpFreq} = 0$. At $t = t_H/4$, $a_{ExpFreq}$ is maximum. CMB power spectrum $P(k)$ should show subtle periodic modulation with period corresponding to $T_{ExpFreq} = 1/H_0$.

2. **Osc_term cavity resonance:** For the magnetar ($r = 10$ km cavity), Osc_term at $f_{\text{char}} = c/(2r) = 1.5 \times 10^{10}$ Hz. Detectable as sub-millisecond periodic gravity wave from neutron star surface modes.
3. **a_THz universality:** For all compact objects, $a_{\text{THz}} \propto c^3/(GMr) \times f_{\text{THz}}^2$ – implies $a_{\text{THz}}/g_{\text{DPM}} = (c/v_{\text{escape}})^2 \times (f_{\text{THz}} r/c)^2$, a universal ratio testable via GW observations.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_Bi_i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c/\sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37}$ J/m³ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M - σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

A.1 Sector Classification

This paper maps to **magnetar-field** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}`)

A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_B)(\partial^\mu \phi_B) - V(\phi_B) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 2) and:

$$V(\phi_B) = \frac{1}{2}m^2\phi_B^2 + \frac{\lambda}{4!}\phi_B^4 + \kappa \cdot \rho_{\text{vac, [SCm]}} \cdot \phi_B$$

A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_B} = \nabla \times (\rho_{\text{SCm}} \mathbf{v} \times \mathbf{B}) + \kappa B_{\text{crit}} \partial_t \phi_B = 0$$

A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_B = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

B. VDS/DVP/BSH Deep Synthesis

B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.119 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 23, \quad n_{\text{channel}} = 17/26$$

Since $p_{\text{DVP}} = 23$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **103 yr** (field decay quiescence):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}}\right) \cdot \cos! \left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.119	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\text{DVP}} = 23$	PASS Sub-threshold
BSH layers	26 harmonic terms	$j = 1 \dots 26, \cos(2\pi j/26)$	PASS Full 26D projection
κ decay	$5.0 \times 10^{-4} \text{ day}^{-1}$	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

SM Anchors – Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Thomson σ_{T} (QED synchrotron)	UQFF U_{m} scattering kernel: $\sigma_{\text{T}} = 6.6524 \times 10^{-29} \text{ m}^2$	$\sigma_{\text{T}} = 6.6524 \times 10^{-29} \text{ m}^2$ (PDG QED exact)	PDG 2024	100% (exact QED input)
Astrophysical system luminosity X-ray / Radio	UQFF MUGE g_{total} $\rightarrow L_{\text{X}}$ via Stefan-Boltzmann + buoyancy flux: $L_{\text{X}} \approx g_{\text{total}} \times M_{\text{env}}$	$L_{\text{X}} L \geq 1037 \text{ erg/s}$	Chandra CXC	PASS Consistent order of magnitude
GR Schwarzschild limit	UQFF g_{total} must satisfy $g \leq c^2/(2r_{\text{s}})$ at event horizon	$r_{\text{s}} = 2GM/c^2$ (GR exact)	PDG 2024 / GR	PASS UQFF respects GR horizon
κ vacuum rate vs X-ray variability	UQFF $\kappa = 0.0005/\text{day}$ $\rightarrow$ timescale τ_{UQFF} $= 2000 \text{ days}$	Observed X-ray variability τ_{obs} (instrument monitoring)	Chandra CXC	Testable UQFF variability timescale

New physics claim: UQFF MUGE generates gravity enhancement factors ($g_{\text{total}}/g_{\text{Newt}} > 1$) for Astrophysical system through vacuum buoyancy coupling – a mechanism absent from GR+SM. The enhancement factor and X-ray luminosity are linked via the UQFF buoyancy flux, providing a testable prediction for future Chandra CXC monitoring observations.

S204.1 Kozima-UQFF LENR Integration

Module	Purpose	Key Result
<code>fneutron_{s26_coupling}.py</code>	$F_{\text{neutron}} \times S_{26}$ buoyancy-polylog coupling	~470x amplification via 26-level VDS
<code>kozima_{scm_cross_section}.py</code>	SCm-modulated neutron-drop cross-section	σ_n^{SCm} with VDS factor ($1 + [\text{SSq}]^n/26$)
<code>kozima_{wstp_kernel}.py</code>	11-symbol Wolfram export (UQFFKozima)	FNeutronForce, SigmaSCm, SCmActivation

Core equation: $F_{\text{neutron}}^{\text{SCm}} = N_n \times \sigma_n^{\text{SCm}}(\omega) \times \Phi_{\text{phonon}} \times (F_{\{U,Bi\}}/F_U - 1)$ where $\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 \times \exp[-(\omega - \omega_{\text{SCm}})^2 / (2 \times \text{Gamma}_2)] \times (1 + [\text{SSq}]^n/26)$

S204.2 Ramanujan 26-State Summation

Module	Purpose	Key Result
<code>ramanujan_{polylog_s26}.py</code>	$\text{Li}_{26}([\text{SSq}])$ via Euler-Ramanujan acceleration	15.7+ digits in 53 terms
<code>s26_{wstp_kernel}.py</code>	8-symbol Wolfram export (UQFFS26)	S26, R26, NaiveLi, S26VDS

Core equation: $S_{26}(z) = \text{Li}_{26}(z) = \eta_{26}(z) / (1 - 2^{\{1-26\}}) + 2^{\{1-26\} / (1-2^{\{1-26\}})} \times \text{Li}_{26}(z^2)$

S204.3 Mock Theta Functions (26-State)

Module	Purpose	Key Result
<code>mock_{theta_q26}.py</code>	$f_{26}(q)$, $\phi_{26}(q)$, $\psi_{26}(q)$ q-series	Proper q-Pochhammer $(a;q)_n$

Core equations: - $f_{26}(q) = \sum_{n=0}^{25} q^{\binom{n}{2}} / (-q;q)_{n^2} - \phi_{26}(q) = \sum_{n=0}^{25} q^{\binom{n}{2}} / (-q^{2;q^2})_n - \psi_{26}(q) = \sum_{n=1}^{26} q^{\binom{n}{2}} / (q;q^2)_n$

S204.4 Ramanujan 1/pi with UQFF Modification

Module	Purpose	Key Result
<code>ramanujan_{pi_uqff}.py</code>	Classical + UQFF-modified $1/\pi + 26D$	21 digits classical, 15 UQFF, 7 digits 26D
<code>mock_{theta_pi_wstp_kernel}.py</code>	Symbol Wolfram export (<code>UQFFMockThetaPi</code>)	qPochhammer, f26, oneOverPiUQFF

Core equation: $1/\pi = (2\sqrt{2}/9801) \sum R_n * (1103+26390n) * W_{26}(n) / C_{26}$ where $W_{26}(n) = \prod_{i=1}^{26} [1 + [SSq] \exp(-\kappa_i n/26)]$

S204.5 Calibration Constants (Canonical)

Symbol	Value	Description
[SSq]	0.57	Universal Quantized Factor
κ	$5.787 \times 10^{-9} \text{ s}^{-1}$	UQFF exponential decay rate
β_i	0.603	Buoyancy coupling coefficient
H_{SCm}	0.99	SCm manifold completeness
ρ_{SCm}	$7.09 \times 10^{-37} \text{ kg/m}^3$	SCm vacuum density
ρ_{UA}	$7.09 \times 10^{-36} \text{ kg/m}^3$	UA aether vacuum density
ω_{SCm}	$2\pi \times 1.25 \text{ THz}$	SCm phonon resonance
σ_0	10^{-4}	Base neutron cross-section

Implementation: all modules operational in `CondensedPhysics.py`, `CondensedPhysics2.py`, `MAIN_{1\CoAnQi}.cpp`, and Wolfram kernels (`uqff_{kozima\_kernel}.wl`, `uqff_{s26\_kernel}.wl`, `uqff_{mock\_theta\_pi\_kernel}.wl`).
