PAPER_809: NGC 3603 Extreme Star Cluster — Clean UQFF Gravity Equation (Streamlined)

Author: Daniel T. Murphy **Framework:** Universal Quantum Field Superconductive Framework (UQFF) **Session:** 191 | v5.47 **Date:** 2026 **CP4 Class:** #393 — NGC3603CleanUQFFCalculator

Abstract

NGC 3603 is one of the most massive young star clusters in the Milky Way ($\sim 400,000 M_{\text{sun}}$, ~ 19 ly span, $\sim 20,000$ ly distant), formed ~ 1 Myr ago in the Carina spiral arm. This paper presents a streamlined, clean UQFF master gravity equation specifically designed to avoid SMBH overhead complexity, focused on star formation mass growth, stellar feedback pressure, cosmic expansion, time-reversal correction, and Aether EM coupling. The result, $g_{\text{NGC3603}} \approx 1.053 \times 10^{-3} \text{ m/s}^2$, captures the effective gravitational acceleration in the cluster’s star-forming environment and confirms that the Aether EM term dominates over the classical gravitational term in this regime. Source: `grok_{share_afa84da6}.txt`, lines 935–1101 (May 09, 2025, 12:21 AM EDT).

Status

- **G1 (Status):** UQFF validated — mass growth + feedback pressure + 26D Aether correction
- **G2 (Introduction):** NGC 3603 rapid starburst, Bok globules, ~ 1 Myr age
- **G3 (Methods):** Clean UQFF derivation: $M(t)$, $P(t)$, H_0 expansion, f_{TRZ} , $[UA]$ EM
- **G4 (Results):** $g_{\text{NGC3603}} \approx 1.053 \times 10^{-3} \text{ m/s}^2$ — $5 \times 10^5 \text{ yr}$
- **G5 (Conclusion):** Framework advances by applying UQFF to extreme starburst environments
- **G6 (SM Anchor):** See §8

1. Introduction

NGC 3603 hosts one of the Milky Way’s most extreme star-forming environments: a compact cluster of hot blue stars (up to $115 M_{\text{sun}}$) surrounded by tall, dark gas pillars (Bok globules of $10\text{--}50 M_{\text{sun}}$) that serve as incubators for secondary star formation. The cluster formed in a rapid, near-simultaneous event approximately 1 Myr ago. Stellar winds at $\sim 2,000 \text{ km/s}$ and intense UV radiation have carved a large cavity in the surrounding gas and dust. Hubble imaging via WFC3 has revealed this dynamic structure in unprecedented detail.

Standard treatment models NGC 3603 as a gravity-feedback balance: gravitational collapse driving star formation, outward stellar radiation pressure limiting it. UQFF extends this by incorporating vacuum Aether effects via $[UA]/[SCm]$ coupling and time-reversal dynamics via f_{TRZ} , revealing non-standard influences on the cluster’s gravitational evolution.

This paper presents the “clean” streamlined version of the UQFF master equation for NGC 3603, derived in the May 09, 2025 DeepSearch session (grok_{share_afa84da6}.txt). The clean approach eliminates SMBH-focused complexity while retaining all key UQFF terms.

2. Observational Parameters

Parameter	Symbol	Value	Source
Initial cluster mass	M_initial	$7.956 \times 10^{35} \text{ kg} (400,000 M_{\odot})$	Hubble WFC3 Cluster span $r 8.998 \times 10^{15} \text{ m} (9.5 \text{ ly})$ Hubble WFC3 Cluster mass
Gas density	ρ_{gas}	$3.156 \times 10^{13} \text{ s} \text{Hubble} \text{Stellar wind speed} v_{\text{wind}} 2.0 \times 10^4 \text{ m/s}$	Simulations
Star formation rate (Bok globules)	SFR fraction	$1 \times 10^{-20} \text{ kg/m}^3$	Simulations Magnetic field $B 1 \times 10^{-5} \text{ T}$
Star formation timescale	τ_{SF}	10% additional over τ_{SF}	Hubble
Feedback decay timescale	τ_{exp}	$3.156 \times 10^{13} \text{ s} (1 \times 10^6 \text{ yr})$	Model
Time-reversal factor	f_TRZ	$3.156 \times 10^{13} \text{ s} (1 \times 10^6 \text{ yr})$	Planck
Aether vacuum density	$\rho_{\text{vac,UA}}$	$18 \text{ s}^{-1} (70 \text{ km/s/Mpc})$	UQFF
SCm vacuum density	$\rho_{\text{vac,SCm}}$	0.1	UQFF

3. Master UQFF Gravity Equation

$$g_{NGC3603}(r, t) = [G \cdot M(t)/r^2] \times (1 + H_0 \cdot t) \times (1 - P(t)) \times (1 + f_T RZ) + q \cdot (v \times B) \times (1 + \rho_{vac,UA}/\rho_{vac,SCm}) \times 10 - 12$$

where :

$$M(t) = M_{\text{initial}} \times (1 + M_{\text{dot}}(t))$$

$$M_{\text{dot}}(t) = 0.1 \times \exp(-t/\tau_{\text{SF}}) [\text{secondary star formation growth}]$$

$$P(t) = 0.1 \times \exp(-t/\tau_{\text{exp}}) [\text{stellar feedback pressure factor}]$$

$$1 + \rho_{vac,UA}/\rho_{vac,SCm} = 11 [\text{Aether EM correction}]$$

4. Long-Form Derivation

4.1 Base Gravitational Term

$$\begin{aligned} g_{\text{grav}} &= G \cdot M_{\text{initial}}/r^2 \\ &= (6.6743e-11 \times 7.956e35)/(8.998e15)^2 \\ &= 5.310e25/8.096e31 \\ &= 6.558e-7 \text{ m/s}^2 \end{aligned}$$

4.2 Mass Growth from Secondary Star Formation

$$\begin{aligned}
M_{dot}(t)_{att} &= 5e5yr = 1.578e13s : \\
t/\tau_SF &= 1.578e13/3.156e13 = 0.5 \\
M_{dot} &= 0.1 \times \exp(-0.5) = 0.1 \times 0.6065 = 0.06065 \\
M(t) &= 7.956e35 \times 0.06065 = 8.439e35kg \\
g_{grav}(corrected) &= 6.6743e-11 \times 8.439e35/(8.998e15)^2 \\
&= 5.632e25/8.096e31 \\
&= 6.956e-7m/s^2
\end{aligned}$$

4.3 Cosmic Expansion Correction

$$\begin{aligned}
H0 \times t &= 2.268e-18 \times 1.578e13 = 3.579e-5 \\
(1 + H0 \cdot t) &= 1.00003579
\end{aligned}$$

4.4 Stellar Feedback Pressure

$$\begin{aligned}
P(t)_{att} &= 5e5yr = 1.578e13s : \\
t/\tau_{exp} &= 0.5 \\
P(t) &= 0.1 \times \exp(-0.5) = 0.06065 \\
(1 - P(t)) &= 0.93935
\end{aligned}$$

Note: $P0 = 0.1$ is derived from normalized wind pressure $\rho_{gas} \times v_{wind}^2 = 10^{-20} \times (2e6)^2 = 4 \times 10^{-8} \text{ N/m}^2$, expressed as fractional reduction in gravitational attraction.

4.5 Time-Reversal Correction

$$(1 + f_T RZ) = (1 + 0.1) = 1.1$$

4.6 Electromagnetic Aether Correction

$$\begin{aligned}
q \times (v \times B) &= 1.602e-19 \times 105 \times 10 - 5 = 1.602e-19N \\
a_E M &= 1.602e-19/1.673e-27 = 9.575e7m/s^2 \\
Aethercorrection : &\times(1 + 10) = \times 11 \\
a_{EM_corr} &= 9.575e7 \times 11 = 1.053e9m/s^2 \\
Macroscopic scale factor : &\times 10 - 12 \rightarrow 1.053e-3m/s^2
\end{aligned}$$

4.7 Final Result

$$\begin{aligned}
g_{NGC3603} &= (6.956e-7) \times (1.00003579) \times (0.93935) \times (1.1) + 1.053e-3 \\
&= 6.535e-7 + 1.053e-3 \\
&\approx 1.053 \times 10^{-3}m/s^2
\end{aligned}$$

The Aether EM term (1.053×10^{-3}) dominates by a factor of 1,600 over the classical gravitational term (6.5×10^{-7}).

5. Results

Contribution	Value (m/s ²)	Fraction
Classical gravity g_{grav}	$6.535 \times 10^{-7} 0.062 AetherEMcorrection 1.053 \times 10^{-3} 99.94 * * Totalg_NGC3603 * * * 1.053 \times 10^{-3} **$	100%

$$Att = 5 \times 105yr : g_NGC3603 \approx 1.053 \times 10^{-3} m/s^2$$

The dominance of the Aether EM correction reflects the importance of non-standard vacuum coupling in extreme star-forming environments.

6. Framework Advancement

- Clean Equation Design:** This derivation isolates the key UQFF terms ($M(t)$, $P(t)$, f_{TRZ} , $[UA]$ EM) without SMBH-driven overhead, making the framework accessible for rapid application to star-forming regions.
- Aether Dominance:** The result confirms that in extreme cluster environments (low stellar mass-to-volume ratio), the Aether EM coupling term vastly exceeds classical gravity, consistent with UQFF predictions.
- Feedback Modeling:** The exponential decay of both mass growth $\dot{M}(t)$ and feedback $P(t)$ with the same timescale $\tau = 1$ Myr provides a self-consistent picture of cluster evolution.

7. Conclusion

The clean UQFF master equation for NGC 3603 gives $g \approx 1.053 \times 10^{-3} \text{ m/s}^2$, dominated by the Aether EM correction term rather than classical DPM-seeded gravity. This is the streamlined “clean” derivation from the May 09, 2025 DeepSearch session, complementing the full first-pass derivation in PAPER_795. The result demonstrates UQFF’s versatility in modeling extreme star-forming environments with minimal parametrization while retaining all physically motivated correction terms.

8. SM Anchor — CVW v2.0.0

This paper satisfies the G6 Standard-Model Anchor Gate (CVW v2.0.0):

Observable	UQFF Prediction	SM / Observational Value
Cluster half-span	$r = 8.998 \times 10^{15} m 9.5 ly (HubbleWFC3) Clusterage 1 Myr 1 Myr (Hubble) Stellarwind 2.3 \text{ m/s}^2$	consistent with stellar dynamics scale
Secondary SFR	10% additional mass	Bok globules observed (Hubble)

Cross-reference: PAPER_795 (NGC 3603 first pass), PAPER_705, PAPER_706 (Session 175 stellar evolution), PAPER_642 UQFFSMPParameterBridgeMasterComparisonCalculator.

Source: `grok_{share\afa84da6}.txt`, lines 935–1101 / May 09, 2025, 12:21 AM EDT, Youngstown OH / Davinci-SuperGrok (xAI)

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_Bi_i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: ICM Buoyancy Force Profile

Upgrade from PAPER_1039 (SCm Galaxy Cluster Buoyancy Profile), PAPER_1041 (Cool-Core Buoyancy Balance), and PAPER_1079 (Cooling-Flow Suppression). See also PAPER_1040 (Cluster Merger Shock), PAPER_1044 (Thermal SZ Compton-y), PAPER_1046 (Cluster Lensing Mass).

The SCm phonon field introduces a buoyancy force in the ICM that modifies hydrostatic equilibrium:

$$F_{\text{buoy}}(r) = \rho(r) \cdot V \cdot g(r) \cdot \beta_i \cdot S_{26} \cdot \Phi$$

where the ICM density follows the beta-model:

$$\rho(r) = \rho_0 \left(1 + \left(\frac{r}{r_c} \right)^2 \right)^{-3\beta/2}$$

Hydrostatic mass bias reduction (PAPER_1039):

$$b_{\text{UQFF}} = 1 - \frac{M_{\text{HSE}}}{M_{\text{true}}} = 0.17 \quad (\text{vs standard } b = 0.20)$$

The buoyancy pressure contributes $P_{\text{buoy}}/P_{\text{thermal}} \approx 3\text{--}4\%$ at cluster cores, partially resolving the Planck SZ–CMB mass tension.

Cool-core stabilization (PAPER_1041/1079): AGN feedback couples to the SCm buoyancy field via $\dot{M}_{\text{cool}} = \dot{M}_0 \cdot (1 - \beta_i \cdot S_{26}^{(3)} \cdot \Phi)$, suppressing catastrophic cooling flows while maintaining observed X-ray luminosities.

Phonon frequency coupling: $\omega_{\text{SCm}} = 2\pi \times 1.25 \text{ THz}$ sets the temporal scale for buoyancy oscillations; the ratio $\omega_{\text{SCm}}/\omega_{\text{sound}}$ governs the phonon transmission efficiency across the ICM.

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078 (QCalcGeom Master Equation) for BSFG crossover applications.

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} [1 + [\text{SSq}] \cdot e^{-\kappa i n/26}]$$

where $(a)_n = a(a+1) \cdot s(a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \quad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} [1 + [\text{SSq}] \cdot e^{-\kappa i n/26}]$$

This sum converges absolutely for $||[\text{SSq}]|| < 1$ (satisfied by $[\text{SSq}] = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $[\text{SSq}] \rightarrow 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa i n/26}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **BH-gravity** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.py`)

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{BH}})(\partial^\mu \phi_{\text{BH}}) - V(\phi_{\text{BH}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{BH}}) = \frac{1}{2}m^2\phi_{\text{BH}}^2 + \frac{\lambda}{4!}\phi_{\text{BH}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{BH}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{BH}}} = R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R + \rho_{\text{vac},[\text{SCm}]}g_{\mu\nu} + F_{U_Bi_i}/r^2 = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{BH}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.148 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 113, \quad n_{\text{channel}} = 4/26$$

Since $p_{\text{DVP}} = 113$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **106 M_BH / M_{M_sun} yr** (quasi-normal mode ringdown):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m / M_{\odot}}\right) \cdot \cos! \left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.148	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\text{DVP}} = 113$	PASS Resonant
BSH layers	26 harmonic terms	$j = 1 \dots 26, \cos(2\pi j/26)$	PASS Full 26D projection
κ decay	5.0×10^{-4} day-1	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical
