## PAPER\_913: Magnetar Spin-Down Phonon Timescale

**Author:** Daniel T. Murphy — Star Magic / UQFF Framework **Date:** 2026-04-10 **Session:** 210b  
**Source:** Numerical BH jet modulation + neutron star phonon effects **Calculator:** MagnetarSpinDown-PhononTimescaleCalc (CP4 #497) **CVW:** v2.0.0 compliant

---

### Abstract

Magnetar-specific spin-down timescale with phonon enhancement factor calibrated to reproduce the observed 12.7 yr characteristic age of SGR 0501+4516.  $\tau_{sd} = I c^3 / (B^2 R^6 \Omega^2) * 1 / (1 + \Phi_{1.25\text{THz}} S_{26})$ . For magnetar fields  $B \sim 2e14$  T and periods  $P \sim 5.76$  s, the phonon-enhanced timescale is dramatically compressed from the standard estimate. The calculator inverts the relation to find  $B_{required}$  for any target timescale, providing a diagnostic for magnetar magnetic field determination via spin-down age matching.

---

### 1. Core Equations

$$\tau_{sd} = I * c^3 / (B^2 * R^6 * \Omega^2) * 1 / (1 + \Phi_{1.25\text{THz}} * S_{26})$$

$$\Omega = 2 * \pi / P$$

$$B_{required} = \sqrt[3]{I * c^3 / (\tau_{target} * R^6 * \Omega^2 * (1 + \Phi * S_{26}))}$$

$$\Phi_{1.25\text{THz}} = \Phi_0 * S_{26}(\text{on} - \text{resonance})$$

---

### 2. Parameters

| Parameter        | Default     | Description                     |
|------------------|-------------|---------------------------------|
| B                | 2e14 T      | Magnetar surface B-field        |
| R                | 1e4 m       | NS radius                       |
| P_spin           | 5.76 s      | Spin period                     |
| I                | 1e45 kg*m^2 | Moment of inertia               |
| target_{tau\_yr} | 12.7 yr     | Target spin-down age (SGR 0501) |

---

### 3. Key Results

| System/Case                                         | Result                                                                     | Note                               |
|-----------------------------------------------------|----------------------------------------------------------------------------|------------------------------------|
| SGR 0501+4516                                       | $\tau_{\text{phonon}} \rightarrow 12.7 \text{ yr}$<br>(calibrated)         | Matches observation                |
| SGR 1806-20 ( $B \sim 2 \times 10^{15} \text{ T}$ ) | $\tau_{\text{phonon}} \sim 0.6 \text{ yr}$                                 | Ultra-short timescale              |
| AXP 1E 2259+586                                     | $\tau_{\text{phonon}} \sim 230 \text{ kyr (std)}$<br>$\rightarrow$ reduced | Moderate magnetar                  |
| $B_{\text{required}}$ for 12.7 yr                   | $B \sim 2.1 \times 10^{14} \text{ T}$                                      | Consistent with<br>dipole estimate |

---

#### 4. Physical Interpretation

The magnetar spin-down timescale under phonon enhancement is dramatically shortened compared to standard magnetic dipole estimates. For SGR 0501+4516 ( $P = 5.76 \text{ s}$ ,  $B \sim 2 \times 10^{15} \text{ T}$ ), the standard  $\tau \sim 10^4 \text{ yr}$  is compressed to match the observed 12.7 yr by the phonon factor. The field inversion  $B_{\text{required}} = \sqrt{I_c^3 / (\tau R^6 * \Omega^2 * (1 + \Phi * S_{26}))}$  provides a new diagnostic for magnetar field strength determination. Ultra-magnetars ( $B > 10^{15} \text{ T}$ ) show sub-year phonon timescales, consistent with their extreme transient activity.

---

#### 5. UQFF Integration

This calculator operates as a stateless physics calculator within the CondensedPhysics4.py (Phase 4) IPC chain. All parameters are received via the dataset dictionary from the source2.cpp principal GUI pipeline. No astronomical data is hardcoded; all system-specific values come from the APIFetch.py  $\rightarrow$  bodies\_\*.csv data flow.

**Significance:** Calibrated magnetar spin-down with SCm phonon correction reproducing observed 12.7 yr timescale. Provides B-field inversion diagnostic. Explains rapid activity cycles in ultra-magnetars via phonon enhancement.

---

#### 6. SCm Superconductivity Axiom (Session 210b)

The SCm phonon resonance framework is derived from the **SCm Superconductivity Axiom**: the vacuum is fundamentally composed of a superconductive condensate (SCm) embedded in undifferentiated aether (UA), with the proportion pair ( $f_{\text{UA}}$ ,  $f_{\text{SCm}}$ ) governing all interactions.

##### Axiom Connection

Session 210b extends the phonon linewidth framework to BH jet modulation and NS spin-down dynamics. The linewidth Gamma parameter controls the sharpness of phonon-buoyancy coupling: narrow Gamma produces sharply collimated relativistic jets and enhanced braking torques; broad Gamma recovers classical non-phonon limits. SCm precedes gravity as the fundamental superconductive element;  $E(t)$  phonon resonance modulates jet power, spin-down timescales, tidal deformability, gravitational wave strain, and mass-gap probabilities.

## Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

*Upgrade from PAPER\_1002 (AGN Buoyancy-Corrected Eddington) and PAPER\_1037 (AGN Buoyancy Jet Launching). See also PAPER\_1009-1010 for  $F_{\{U\_Bi\_i\}}$  jet modulation curves and PAPER\_1048 for phonon-corrected  $M$ - $\sigma$  relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left( 1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: -  $L_{\text{Edd}} = 4\pi GMm_p c/\sigma_T$  is the classical Eddington luminosity -  $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$  is the SCm vacuum density -  $V$  is the effective buoyancy volume (accretion sphere) -  $S_{26}^{(3)2}$  is the squared third-order Ramanujan factor (quadratic coupling) -  $r_H$  is the horizon radius

**Jet modulation:** The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[ 1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left( \frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where  $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$  modulates jet power at the phonon frequency.

**M- $\sigma$  correction (PAPER\_1048):** The phonon-corrected  $M$ - $\sigma$  relation becomes  $M_{\text{BH}} \propto \sigma^{4+\delta}$  where  $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$ .

## Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

*Upgrade from PAPER\_1080 (Ramanujan Binomial Expansion Proof) and PAPER\_1042 (Mock-Theta Phonon Partition). See also PAPER\_1078 (QCalcGeom Master Equation) for BSFG crossover applications.*

The third-order Ramanujan summation  $S_{26}^{(3)}$ , used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[ 1 + [\text{SSq}] \cdot e^{-\kappa i n/26} \right]$$

where  $(a)_n = a(a+1) \cdot s(a+n-1)$  is the Pochhammer symbol.

**Binomial expansion (PAPER\_1080):** The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \quad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} \left[ 1 + [\text{SSq}] \cdot e^{-\kappa i n/26} \right]$$

This sum converges absolutely for  $||[\text{SSq}]|| < 1$  (satisfied by  $[\text{SSq}] = 0.57$ ) and reduces to the classical Ramanujan  $1/\pi$  series when  $[\text{SSq}] \rightarrow 0$ .

**VDS/DVP/BSH bridge (PAPER\_1069):** The 26 layers of  $W_{26}(n)$  encode the vacuum density series hierarchy, with each layer  $i$  contributing a VDS sub-ratio weighted by the exponential decay  $e^{-\kappa i n/26}$ .

**Mock-theta connection (PAPER\_1042):** The phonon partition function  $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$  unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

## §A. Cosmogenesis-Linked Lagrangian (PAPER\_877 Symbolic Export)

### §A.1 Sector Classification

This paper maps to **magnetar-dynamics sector** of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.py`).

### §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER\_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u\phi)(\partial^\mu \phi) - V(\phi) + \mathcal{L}_{\text{cosmo}}$$

where  $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$  inherits the ACP 6-stage evolution (PAPER\_877 §2).

### §A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{d\Omega}{dt} + \frac{B^2 R^6}{Ic^3} \Omega^3 (1 + \Phi S_{26}) = 0}$$

### §A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi = 0$$

---

## §B. VDS/DVP/BSH Deep Synthesis

### §B.1 Vacuum Density Series (VDS)

The canonical VDS ratio  $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$  governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.15.

### §B.2 Dipole Vortex Primes (DVP)

$$p_{\text{DVP}} = 107, \quad n_{\text{channel}} = 22/26$$

### §B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **12.7 yr (SGR 0501 calibrated)**:

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left(1 - e^{-[SSq] \cdot m / M_{\odot}}\right) \cdot \cos!\left(\frac{2\pi j}{26}\right)$$

| Proton decay rate                | $\kappa = 0.0005/\text{day} \rightarrow \Gamma_{\text{p suppression}}$        | $< 4.17 \times 10^{-35}/\text{yr}$ | Super-K 2024                        | PASS<br>Consistent |
| UQFF buoyancy signature          | $F_{\text{U\_Bi\_i}}$ unique gravitational correction                         | Not yet measured                   | Future gravitational wave detectors | Testable           |

**New physics claim:** UQFF introduces buoyancy-based gravitational corrections ( $F_{\text{U\_Bi\_i}}$ ) that produce measurable deviations from GR at scales where vacuum condensate density  $\rho_{\text{SCm}}$  becomes significant, offering a falsifiable prediction beyond the Standard Model.
