Abstract

Universal Magnetism (Um) in UQFF is a general magnetic energy density operator that scales with vacuum density ρ_{vac} and an exponential damping factor $(1 - e^{-\kappa t})$. This paper catalogs all named Um sub-variants extracted from the BB_C_Equations_04Sept2025.pdf, covering 50+ unique astrophysical and cosmological regimes: cosmological magnetism, reheating, BBN, MHD dynamo, quasi-normal modes, Blandford-Znajek, photo-evaporation, planet migration, terminal velocity, Press-Schechter, star formation efficiency, BH entropy, evaporation, angular momentum, jet velocity, GW chirp mass, QNM, duty cycle, peculiar velocity, ionization, deuterium, Friedmann-1, QNM damping, Arnett, reheating, Kazantsev dynamo, Alfvén Mach, field reversal, and more.

UQFF Discovery: Novel application of UQFF calibration constants ($\kappa = 5.0 \times 10^{-4} \text{ day}^{-1}$, $[SSq] = 0.57$) uniquely enabling this analysis — establishing a new connection in the UQFF framework not present in Standard Model treatments.

1. Universal Magnetism General Form

$$\text{Um}, X(\text{arg}) = [S_j \mu_j(t, \rho_{\text{vac}}, [SCm]) / r_j] \times (1 - e^{-\kappa t}) \cdot \cos(\text{pt}_n) \times F_X$$

or (single j variant):

$$\text{Um}, X(\text{arg}) = \mu(\rho_{\text{vac}}) \times (1 - e^{-\kappa t}) \times F_X$$

where:

μ_j = magnetic moment density at scale j

$\rho_{\text{vac}}, [SCm]$ = superconductive vacuum density

κ = exponential decay rate

t_n = normalized time: $t_n = t / t_{\text{Hubble}} \cdot (1 + H(z) \cdot t_0)$

F_X = system-specific magnetic function
