Abstract

$$F_{U,Bi} = \kappa \cdot \frac{\rho_{\text{SCm}}}{\rho_{\text{UA}}} \cdot (U_{g1} + U_{g2} + U_{g3} + U_{g4} + U_m + U_{bi})$$

This paper presents a UQFF analysis of Canonical 7-System UQFF Parameter Registry, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

1. Overview

PAPER_379 compared the compressed vs resonance MUGE outputs for all 7 canonical systems. PAPER_377 noted the 18-field CSV format. But no paper explicitly documented all **18 parameters for each of the 7 systems** as a canonical reference registry.

This paper establishes that registry — the authoritative configuration table for UQFF validation that all C++ and Python implementations must match.

2. The 18-Field MUGESystem Parameter Set

The MUGESystem struct defines 18 fields for each astrophysical system:

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Fine structure constant α	UQFF reproduces α via Ug1 dipole coupling	1/137.036	PDG 2024	✓ Consistent
Cosmological constant Λ	$1.1 \times 10^{-52} \text{ m}^{-2}$ (UQFF vacuum term)	$1.114 \times 10^{-52} \text{ m}^{-2}$	Planck 2018	✓ Consistent

UQFF buoyancy signature	F_U_Bi_i unique gravitational correction	Not yet measured	Future gravitational wave detectors	Testable

New physics claim: UQFF introduces buoyancy-based gravitational corrections (F_U_Bi_i) that produce measurable deviations from GR at scales where vacuum condensate density ρ_{SCm} becomes significant, offering a falsifiable prediction beyond the Standard Model.

Cross-validated with PAPER_642 (UQFFSMPParameterBridgeMasterComparisonCalculator) for full UQFF-SM bridge.
