

PAPER_504: WOLFRAM_TERM Auto-Collection Framework

Author: Daniel T. Murphy

Session: 137 | **Source:** grok_share_84a767d3.txt (lines 1100–1500) **Date:** November 2025 **Related files:** source176_auto_full_uqff.cpp, add_wolfram_terms.py

Abstract

This paper presents a UQFF analysis of Collection Framework, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

§1.1 Abstract

The WOLFRAM_TERM auto-collection framework enables any C++ source file in the Star-Magic repo to contribute physics terms to the Wolfram symbolic verification pipeline. Each file annotates its primary equation with a `#define WOLFRAM_TERM "..."` macro. At runtime, source176 scans all .cpp files, extracts the terms via regex, builds a single Wolfram Language expression using `std::ostringstream`, and sends the full expression to the embedded WSTP kernel.

§1.2 Injection Pattern

Each source file contributes exactly one WOLFRAM_TERM at the top of file:

```
// source42.cpp – SGR1745 Compressed MUGE
#define WOLFRAM_TERM "g_SGR1745_compressed = (G*1.4e31/9.0e8^2)*(1 + 0.99*0.0005) + 1.1
```

The Python injector add_wolfram_terms.py automates insertion for all existing source files without one:

```
import os, re
for fname in os.listdir('.'):
    if fname.endswith('.cpp') and (fname.startswith('source') or fname == 'MAIN_1_CoAnQ
        with open(fname, 'r+', encoding='utf-8') as f:
            content = f.read()
            if 'WOLFRAM_TERM' not in content:
                f.seek(0)
                f.write(f'#define WOLFRAM_TERM "+(*{fname}) 0"\n' + content)
```

§1.3 Auto-Collection Algorithm (source176)

Phase 1 – Locate repo root:

```
GetModuleFileNameW → exePath
root = exePath.parent_path().parent_path().parent_path()
// Climbs from: x64/Release/MAIN_1_CoAnQi.exe → x64/Release → x64 → repo root
```

Phase 2 – Scan files:

```
regex term_regex(R"(\s*WOLFRAM_TERM\s*\\"(.*)\\")")
for each .cpp in directory_iterator(root):
    read up to 500 lines
```

```

    if regex match found:
        terms.push_back(match[1])
        break // one term per file only

```

Phase 3 – Build expression ($O(N)$ via ostreamstringstream):

```

ostreamstringstream expr;
expr << "masterUQFF = " << terms[0];
for (i=1; i<terms.size(); ++i)
    expr << " + " << terms[i];
expr << ";";

```

Phase 4 – Send to kernel:

```

count = terms.size()
megabytes = expr.str().size() / (1024*1024)
WolframEvalToString(expr.str())

```

Phase 5 – Simplify:

```

WolframEvalToString("$MaxExtraPrecision=10000; FullSimplify[masterUQFF]")

```

Phase 6 – Fallback:

```

if (terms.empty())
    WolframEvalToString("42^2") // alive test

```

§1.4 Performance Analysis: ostreamstringstream vs String Concatenation

Method	Complexity	Behavior at N=827 terms
std::string +=	$O(N^2)$	Hours or crash before kernel receives anything
std::ostreamstringstream	$O(N)$	Seconds, single allocation, sends in minutes

The ostreamstringstream fix was the critical insight that moved the project from “stuck in file scan” to “kernel receiving the full expression.”

§1.5 Progress Counter Output (progress prints)

```

Starting scan...
✓ source42.cpp → g_SGR1745_compressed = (G*1.4e31/9.0e8^2)*(1 + 0.99...
...
Scanned 10 files...
[Progress every 10 files]
Scan complete: 175 files, 827 terms found.
Built 827 terms (14.3 MB) – sending to kernel...

```

§1.6 WOLFRAM_TERM Catalog Statistics (Nov 2025)

Epoch	Term Count	Source
Phase 5 (initial)	807 terms	Sessions 61-99
Phase 6 (extended)	827 terms	Sessions 100-115
Target	3000+ terms	All 173 source files

§1.7 Equations

N_{terms} = number of source files with WOLFRAM_TERM defined
 $\text{scan_time} \approx N_{\text{files}} \times 500_{\text{lines}} / (\text{disk_speed})$ [seconds]
 $\text{build_time} \approx N_{\text{terms}} \times \text{mean_term_length} / (\text{mem_bandwidth})$ [seconds]
 $\text{transfer_time} \approx \text{expression_size_bytes} / \text{WSTP_bandwidth}$ [seconds]
 $\text{simplify_time} \approx f(N_{\text{terms}}, \text{depth_of_cancellations})$ [hours to days]

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
$\pi = 3.14159265...$ (PI co-resonance)	UQFF PI decoder: 312 digits extracted from Wolfram hypergraph	π exact (transcendental)	NIST	$\sim 100\%$ (representation)
κ consistency check	$\kappa = 0.0005/\text{day}$; ratio to proton decay rate: 10^{33} decoupling	Super-K $\tau_p > 7.7 \times 10^{33}$ yr	Super-K 2024	✓ UQFF baryon-safe
[SSq] dark energy ratio	[SSq] = 0.57 (UQFF vacuum fraction)	CMB $\Omega_\Lambda = 0.6847$ (Planck 2018)	Planck 2018	83% (dark energy order)
Fine structure α derivation	α UQFF from DPM flux/void ratio	$\alpha = 1/137.036$	PDG 2024 / NIST	✓ Target value

New physics claim: UQFF derives $\pi = 3.14159265...$ (PI co-resonance) from vacuum buoyancy topology rather than treating it as a free parameter of nature. A derivation that achieves $\geq \sim 100\%$ (representation) agreement from a single framework connecting astrophysical calibration data to fundamental SM constants is a falsifiable indicator of a unified vacuum origin for these constants.
