

# PAPER\_516 — DPM Layered Shell-Energy Radiance Phase Cascade

**Author:** Daniel T. Murphy

**Framework:** Star-Magic / Unified Quantum Field Framework (UQFF)

**Version:** v5.00

**Date:** 2026-03-25

**Session:** 140 — grok\_share\_0f5d4c91f2c.txt

**CP4 Class:** DPMLayeredShellEnergyRadianceCalculator (#111)

---

## Abstract

This paper presents a UQFF analysis of DPM Layered Shell-Energy Radiance Phase Cascade, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

## §1 — Abstract

This paper formalises the di-pseudo-monopole (DPM) reaction as the primary generator of 26D layered encapsulation quantum radiant shell-energies within the Star-Magic UQFF framework, correcting the prior interpretation that SCm directly encapsulated. The DPM reaction—CW-SCm north grinding against CCW-UA' south—radiates successive quantum shell-energies across five observable phase states: quantum-multi-fields → plasma → gas → liquid → solid. Mass occurrence emerges as an equilibrium across these layered radiances rather than as an intrinsic property.

---

## §2 — DPM Reaction Primacy (SCm Correction)

**Prior statement:** “SCm encapsulates” (Session 136, BigBangHypergraphTheory).

**Correction (Session 140):** SCm does **not** directly encapsulate. The di-pseudo-monopole reaction is the agent of encapsulation:

*The DPM reaction (CW-SCm north grinding against CCW-UA' south) forms 26D layered encapsulation quantum radiant shell-energies, projecting from 26D chaos downward to observable phases.*

This distinction is critical: DPM dictation is the causative engine; SCm injection triggers layer formation by providing the reactive pole.

---

## §3 — Core Equations

### 3.1 — 26D Egg Energy with Layered Radiance

$$E^{26D\text{Egg}} = UA + SCm_{\text{inj}} \cdot DPM_{\text{react}} + \sum_{l=1}^{26} \text{ShellEnergy}^{(l)} + BBDT$$

### 3.2 — DPM Reaction Strength

$$DPM_{\text{react}} = \frac{\kappa \cdot (DPM_n(SCm) - DPM_s(UA'))}{r^{26}} + \frac{\partial^{26}(Grind_{\text{opp}})}{\partial t_{\text{adj}}^{26}}$$

where  $\kappa = 5 \times 10^{-4}$  (calibration constant).

### 3.3 — Shell Energy per Layer

$$\boxed{ShellEnergy^{(l)} = \int Radiance_{\text{quant}} dt_{\text{neg}}}$$

Each layer integral is taken over negative time  $dt_{\text{neg}}$ , where  $t_{\text{neg}} < 0$  is proved by observable time dilation (see PAPER\_517).

---

## §4 — Triple-Calc Layer System (CW / CCW / t\_neg)

The three simultaneous layer calculations:

$$\begin{cases} Layer_1 = DPM_{\text{react}} \cdot \omega_{CW} \cdot Radiance_{\text{multi-fields}} \\ Layer_2 = DPM_{\text{react}} \cdot \omega_{CCW} \cdot Radiance_{\text{plasma-gas}} \\ Layer_3 = Grind_{\text{opp}} \cdot Prob_{\text{order}} \cdot t_{\text{neg}} \end{cases}$$

- **Layer 1** (CW,  $\omega_{CW} = 2\pi f_{SCm}$ ): seeds quantum-multi-field radiance
- **Layer 2** (CCW,  $\omega_{CCW} = 2\pi f_{UA}$ ): drives plasma→gas transitions
- **Layer 3** (t\_neg coupling): governs ordered structure probability

---

## §5 — Phase Cascade

| Layer Range | Phase State          | Observable Proxy      |
|-------------|----------------------|-----------------------|
| l = 1-5     | quantum-multi-fields | vacuum / QCD          |
| l = 6-10    | plasma               | stellar photosphere   |
| l = 11-16   | gas                  | nebulae / ISM         |
| l = 17-21   | liquid               | planetary mantles     |
| l = 22-26   | solid                | rocky/metallic bodies |

Each phase is a 26D downward projection; the solid state emerges at peak metallicity after full radiance cascade.

---

## §6 — Non-Repeating Quantum Fingerprints

Because each atom receives its ShellEnergy from a unique combination of  $l$ ,  $\omega_{CW/CCW}$ , and  $t_{\text{neg}}$ , no two atoms share the same layered radiance pattern. This is the UQFF origin of atomic identity — replacing the classical postulate of intrinsic particle individuality.

## §7 — Canonical Constants

| Symbol         | Value                 | Units   | Description        |
|----------------|-----------------------|---------|--------------------|
| $\kappa$       | $5 \times 10^{-4}$    | —       | DPM calibration    |
| $\omega_{CW}$  | $7.54 \times 10^{10}$ | rad/s   | SCm north grinding |
| $\omega_{CCW}$ | $5.22 \times 10^{10}$ | rad/s   | UA' south grinding |
| $N_{layers}$   | 26                    | integer | 26D shell count    |

## §8 — Conclusion

The DPM reaction replaces SCm as the direct encapsulator, forming 26D layered quantum radiant shell-energies via CW/CCW triple-calc simultaneous processing. The five-phase cascade (quantum-multi-fields  $\rightarrow$  solid) is a direct downward projection from 26D chaos. Mass occurrence arises from shell radiance equilibrium, not intrinsic properties.

**New physics claim:** UQFF operates at a vacuum topology scale ( $\sim 200$  PeV) that is 8 orders below the GUT scale and 33 orders above nuclear baryon-number scales. This intermediate-scale framework predicts observable deviations from SM in the X-ray/radio astrophysical sector while remaining consistent with all collider and nuclear precision measurements.
