## Abstract

Quantized vortices arise naturally in the UQFF Aether superfluid when angular momentum exceeds  $n\hbar$ . We compute the circulation  $\kappa_v = nh/m_{\text{UA}}$ , vortex core  $a_v \approx \xi_{\text{UA}}e^{-n\pi}$ , and vortex energy per unit length  $E_v/L = \rho_{\text{UA}}\kappa_v^2/(4\pi) \ln(R/a_v) \cdot (\rho_{\text{UA}}/\rho_{\text{SCm}})$ . The UQFF Magnus force on a vortex is enhanced by  $(1 + f_{\text{TRZ}}\rho_{\text{UA}}/\rho_{\text{SCm}})$ .

---

## Primary UQFF Equation

$$\kappa_v = \frac{nh}{m_{\text{UA}}}, \quad \frac{E_v}{L} = \frac{\rho_{\text{UA}}\kappa_v^2}{4\pi} \ln \frac{R}{a_v} \cdot \frac{\rho_{\text{UA}}}{\rho_{\text{SCm}}}$$

**New physics claim:** UQFF introduces buoyancy-based gravitational corrections (F\_U\_Bi\_i) that produce measurable deviations from GR at scales where vacuum condensate density  $\rho_{\text{SCm}}$  becomes significant, offering a falsifiable prediction beyond the Standard Model.
