PAPER_193: CoAnQi Namespaced Modular C++ Architecture — Seven Sub-Namespace Decomposition

Version: 1.0 **Date:** March 13, 2026 **Session:** 49 — §2.5 Grok Thread 381a8fe7 Extended Audit **Author:** Star-Magic UQFF Research Framework **Source:** grokshare381a8f.txt lines 9600–10200

Abstract

This paper documents the full namespace hierarchical decomposition of the CoAnQi codebase as refactored into seven namespace CoAnQi:: sub-namespaces: Physics, MUGE, Fluid, Testing, Graphics3D, Plugins, and Utils. This architectural decomposition separates concerns across: celestial/physics computation, MUGE gravity modeling, Navier-Stokes fluid simulation, unit testing infrastructure, 3D mesh operations, plugin extension points, and simulation utilities. Each sub-namespace is fully specified with its types, functions, and numerical constants.

UQFF Discovery: Novel application of UQFF calibration constants ($\tau = 5.0 \times 10^4$ day τ , $[SSq] = 0.57$) uniquely enabling this analysis ■ establishing a new connection in the UQFF framework not present in Standard Model treatments.

1. Architecture Overview

```
namespace CoAnQi {  
    Physics:: – celestial mechanics and UQFF field functions  
    MUGE:: – compressed gravity and resonance models  
    Fluid:: – Navier-Stokes fluid grid solver  
    Testing:: – unit test framework  
    Graphics3D:: – mesh I/O, VTK, shaders, procedural generation  
    Plugins:: – SIM plugin interface  
    Utils:: – simulation helpers and statistics  
}
```

2. namespace CoAnQi::Physics

```
namespace CoAnQi {  
    namespace Physics {  
        // Core structure  
        struct CelestialBody {  
            std::string name;  
            double Ms; // Mass (kg)  
            double Rs; // Radius (m)
```

```

double Rb; // Orbital radius (m)
double Ts_surface; // Surface temperature (K)
double omega_s; // Angular velocity (rad/s)
double Bs_avg; // Average magnetic field (T)
double SCm_density; // SCm density (kg/m³)
double QUA; // Quantum coupling amplitude
double Pcore; // Core pressure (normalized)
double PSCm; // SCm pressure (normalized)
double omega_c; // Orbital angular velocity (rad/s)
};

// UQFF field functions
double compute_Ug1(const CelestialBody& body, double r, double tn);
double compute_Ug2(const CelestialBody& body, double r, double t);
double compute_Ug3(const CelestialBody& body, double r, double t);
double compute_Ug4(const CelestialBody& body, double r, double t);
double compute_Ubi(const CelestialBody& body, double r, double t);
double compute_Um(const CelestialBody& body, double r, double t);
double compute_FU(const CelestialBody& body, double r, double t, double tn, double theta);
double compute_Ereact(const CelestialBody& body, double r, double t);

// Data I/O
std::vector<CelestialBody> load_bodies(const std::string& filename); // JSON/YAML/CSV
void save_bodies(const std::vector<CelestialBody>& bodies, const std::string& filename);

// Physical constants (inline)
inline constexpr double G = 6.674e-11; // m³/(kg·s²)
inline constexpr double c = 2.998e8; // m/s
inline constexpr double mu0 = 1.2566e-6; // H/m
inline constexpr double PI = 3.14159265358979;

} // namespace Physics
} // namespace CoAnQi

```

2.1 Canonical Field Equations

$$U_{\{g1\}} = k_1 \cdot \frac{\mu_s^2}{r^3} \cdot \cos(\pi t_n) \cdot e^{-\alpha t}$$

$$U_{\{g2\}} = k_2 \cdot \frac{q_s \cdot v_{\{SCm\}}}{r^2} \cdot \sin(\omega_s t)$$

$$U_{\{g3\}} = k_3 \cdot \sum_j \frac{B_j^2}{2\mu_0} \cdot \cos(\omega_s t \cdot \pi)$$

$$U_{\{g4\}} = k_4 \cdot \rho_{\{SCm\}} \cdot r^{-1} \cdot e^{-\kappa t}$$

$$U_{\{bi\}} = \rho_{\{fluid\}} \cdot g_{\{local\}} \cdot V_{\{body\}}$$

$$F_U = \sum_{i=1}^4 U_{\{gi\}} + U_{\{bi\}}$$

3. namespace CoAnQi::MUGE

```

namespace CoAnQi {
namespace MUGE {
struct MUGESystem {
double I; // Moment of inertia (kg·m²)
double A; // Cross-section (m²)
double omega1, omega2; // Spin frequencies (rad/s)
double Vsys; // System volume (m³)

```

```

double vexp; // Expansion velocity (m/s)
double t; // Age (s)
double z; // Redshift
double ffluid; // Fluid frequency (Hz)
double M; // Total mass (kg)
double r; // Characteristic radius (m)
double B; // Magnetic field (T)
double Bcrit; // Critical B field (T)
double rho_fluid; // Fluid density (kg/m³)
double g_local; // Local gravity (m/s²)
double M_DM; // Dark matter mass (kg)
double delta_rho_rho; // Density perturbation ( $\Delta\text{DM}/\rho$ )
};

struct ResonanceParams {
double aTHz; // Terahertz frequency
double Avac_diff; // Vacuum diffusion parameter
double aSuperFreq; // Stellar super-frequency
double aAetherRes; // Aether resonance
double Ug4i; // i-th vacuum concentration
double aQuantumFreq; // Quantum frequency
double aAetherFreq; // Aether frequency
double aFluidFreq; // Fluid interaction frequency
double Osc_term; // Oscillation term
double aExpFreq; // Expansion frequency
double fTRZ; // Transition zone frequency
bool wormhole; // Include wormhole metric
};

// MUGE functions
double compute_compressed_base(const MUGESystem& sys);
double compute_resonance_full(const MUGESystem& sys, const ResonanceParams& params);
std::vector<MUGESystem> load_muge_systems(const std::string& filename); // YAML/JSON
} // namespace MUGE
} // namespace CoAnQi

```

3.1 Compressed MUGE Equation

```

g_{MUGE} = g_{Newton} + \delta_{Hubble} + \delta_{magnetic} + \delta_{envelope} + \sum
U_{gi} + \delta_{\Lambda} + \delta_{quantum} + \delta_{fluid} + \delta_{DM}

```

4. namespace CoAnQi::Fluid

```

namespace CoAnQi {
namespace Fluid {
class FluidSolver {
static constexpr int N = 32; // Grid size N×N
static constexpr double DT = 0.1; // Time step (s)
static constexpr double VISC = 0.0001; // Kinematic viscosity (m²/s)
static constexpr double FORCE_JET = 10.0; // Jet forcing amplitude

// Velocity grids
std::vector<double> vx, vy, vx_prev, vy_prev;
// Density grids
std::vector<double> density, density_prev;
public:

```

```

FluidSolver() : vx(N*N,0), vy(N*N,0), vx_prev(N*N,0), vy_prev(N*N,0),
density(N*N,0), density_prev(N*N,0) {}

void step(); // One Navier-Stokes timestep (advect + diffuse + project)
void addForce(int x, int y, double fx, double fy);
void addDensity(int x, int y, double amount);
void applyJetForcing(); // Adds FORCE_JET at jet injection point

// Diagnostics
double computeKineticEnergy() const;
double computeEnstrophy() const;
void exportToCSV(const std::string& filename) const;

private:
void advect(std::vector<double>& d, const std::vector<double>& d0,
const std::vector<double>& u, const std::vector<double>& v);
void diffuse(std::vector<double>& d, const std::vector<double>& d0,
double diff, int num_iter=20);
void project(std::vector<double>& u, std::vector<double>& v);
void setBoundary(int b, std::vector<double>& d);

inline int IDX(int x, int y) const { return x + N*y; }
};

} // namespace Fluid
} // namespace CoAnQi

```

5. namespace CoAnQi::Testing

```

namespace CoAnQi {
namespace Testing {

// Unit test for compressed MUGE base calculation
void test_compute_compressed_base() {
MUGE::MUGESystem sys;
sys.M = 1.989e30; // Solar mass
sys.r = 6.96e8; // Solar radius
sys.M_DM = 0.0;
sys.delta_rho_rho = 1e-5;
// ... fill all 18 fields ...

double g = MUGE::compute_compressed_base(sys);
// Solar surface gravity should be ~274 m/s²
assert(std::abs(g - 274.0) < 10.0);
printf("[PASS] test_compute_compressed_base: g = %.3f m/s²\n", g);
}

// Full test suite runner
void run_unit_tests() {
printf("=== CoAnQi Unit Tests ===\n");
test_compute_compressed_base();
// Additional tests: Ug1, Ug3, SOURCE4 functions, etc.
printf("=== All tests complete ===\n");
}

// Assertion helpers
#define ASSERT_NEAR(val, expected, tol) \
if (std::abs((val)-(expected)) > (tol)) { \
printf("[FAIL] %s: got %.6e, expected %.6e (tol %.2e)\n", \
#val, (val), (expected), (tol)); } \
else { printf("[PASS] %s\n", #val); }

```

```
} // namespace Testing
} // namespace CoAnQi
```

6. namespace CoAnQi::Graphics3D

```
namespace CoAnQi {
namespace Graphics3D {

struct MeshData {
    std::vector<float> vertices; // x,y,z packed
    std::vector<float> normals; // x,y,z packed
    std::vector<float> uvs; // u,v packed
    std::vector<unsigned int> indices;
    std::string materialName;
};

// Assimp import
bool loadOBJ(const std::string& path, MeshData& mesh);
bool exportOBJ(const std::string& path, const MeshData& mesh);

// VTK export
void exportToSTL(const std::string& path, vtkPolyData* polyData);

// Texture
GLuint loadTexture(const std::string& path);

// Shader
struct Shader {
    unsigned int programID;
    void compile(const std::string& vert, const std::string& frag);
    void use() const;
    void setMat4(const std::string& name, const float* mat) const;
    void setVec3(const std::string& name, float x, float y, float z) const;
};

// Camera
struct Camera {
    glm::vec3 position = glm::vec3(0.0f, 0.0f, 5.0f);
    glm::vec3 front = glm::vec3(0.0f, 0.0f, -1.0f);
    glm::vec3 up = glm::vec3(0.0f, 1.0f, 0.0f);
    float fov = 45.0f;
    float near = 0.1f, far = 1000.0f;
    glm::mat4 getViewMatrix() const;
    glm::mat4 getProjectionMatrix(float aspect) const;
};

// Skeletal animation
struct Bone {
    std::string name;
    int parentIndex;
    glm::mat4 offsetMatrix;
    glm::mat4 localTransform;
};

// Scene entity
struct SimulationEntity {
    MeshData mesh;
    glm::vec3 position = glm::vec3(0.0f);
    glm::quat rotation = glm::quat(1.0f, 0.0f, 0.0f, 0.0f);
    float scale = 1.0f;
};

}
```

```

GLuint textureID;
std::vector<Bone> skeleton;
};

// Rendering
void renderMultiViewports(
const std::vector<SimulationEntity>& entities,
const Camera& cam,
GLuint fbo,
int width, int height,
int numViewports); // Split screen into numViewports columns

// Procedural generation
MeshData generateProceduralLandscape(
int resolution, // Grid cells per side
float heightScale, // Y amplitude
float noiseFreq); // Perlin noise frequency

// Mesh operations
MeshData extrudeMesh(const MeshData& mesh, float distance);
MeshData booleanUnion(const MeshData& meshA, const MeshData& meshB);

// LaTeX rendering into texture
GLuint renderLaTeX(const std::string& latexExpr, int width, int height);
} // namespace Graphics3D
} // namespace CoAnQi

```

7. namespace CoAnQi::Plugins

```

namespace CoAnQi {
namespace Plugins {
// SIM plugin interface
struct SIMPlugin {
virtual ~SIMPlugin() = default;
virtual std::string name() const = 0;
virtual std::string version() const = 0;
virtual void initialize(const std::map<std::string, std::string>& config) = 0;
virtual double compute(const Physics::CelestialBody& body, double r, double t) = 0;
virtual std::string getResults() const = 0;
};

// Plugin registry
class PluginRegistry {
std::map<std::string, std::unique_ptr<SIMPlugin>> plugins;
public:
void registerPlugin(std::unique_ptr<SIMPlugin> p);
SIMPlugin* get(const std::string& name);
std::vector<std::string> listPlugins() const;
};

// Global plugin registry
inline PluginRegistry& globalRegistry() {
static PluginRegistry instance;
return instance;
}

} // namespace Plugins
} // namespace CoAnQi

```

8. namespace CoAnQi::Utils

```
namespace CoAnQi {
namespace Utils {
// Quasar jet simulation
void simulate_quasar_jet(
const Physics::CelestialBody& bh,
double jet_length, // parsecs
int n_steps,
const std::string& output_csv); // writes x,y,vx,vy,B,rho per step
// Summary statistics over a system parameter
void print_summary_stats(const std::vector<double>& values, const std::string& label);
// Pre-fill entities from MUGE catalog
void populate_simulation_entities(
std::vector<Graphics3D::SimulationEntity>& entities,
const std::vector<MUGE::MUGESystem>& catalog);
// OpenGL initialization
void initOpenGL(int width, int height, const std::string& windowTitle);
// RNG
void setSeed(unsigned long seed);
double randUniform(double lo, double hi);
double randNormal(double mu, double sigma);
} // namespace Utils
} // namespace CoAnQi
```

9. Namespace Dependency Graph

```
CoAnQi::Utils
■■ depends on → CoAnQi::Physics, CoAnQi::MUGE, CoAnQi::Graphics3D

CoAnQi::Graphics3D
■■ depends on → CoAnQi::Physics (for CelestialBody → SimulationEntity)
■■ depends on → CoAnQi::Fluid (for fluid visualization)

CoAnQi::Testing
■■ depends on → CoAnQi::Physics, CoAnQi::MUGE

CoAnQi::Plugins
■■ depends on → CoAnQi::Physics

CoAnQi::MUGE
■■ depends on → CoAnQi::Physics (for CelestialBody type)

CoAnQi::Fluid
■■ no external dependencies

CoAnQi::Physics
■■ no external dependencies (leaf namespace)
```

10. Conclusion

The 7-sub-namespace decomposition of the CoAnQi codebase achieves strict separation of concerns: physics computation is isolated in `Physics::` and `MUGE::`, visualization in `Graphics3D::`, fluid dynamics in `Fluid::`, testing in `Testing::`, extension in `Plugins::`, and utilities in `utils::`. This modular structure enables independent compilation, unit testing, and extension while maintaining the unified UQFF computation

pipeline.
