$$F_U(r,t) = \sum_{i=1}^4 U_{\{gi\}} + U_m + U_A - U_{\{b_i\}}, \quad \text{quad } \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}, \quad [SSq] = 0.57$$

$$U_{\{b_i\}}(r) = \kappa \cdot [SSq] \cdot \frac{GM}{r^2}, \quad \text{quad } \kappa = 5.0 \times 10^{-4} \text{ day}^{-1}, \quad [SSq] = 0.57, \quad \beta_i = 0.61$$

## Abstract

This paper provides complete reference implementations for 3D mesh I/O in the CoAnQi Graphics3D namespace: `loadOBJ()` using the Assimp library for multi-mesh, multi-normal, multi-UV OBJ import, and `exportToSTL()` using VTK's `vtkSTLWriter` for binary/ASCII STL export. Additional operations documented include `exportOBJ()` for round-trip mesh preservation, `loadTexture()` for OpenGL texture loading, procedural landscape generation via Perlin noise, mesh extrusion, boolean union, and LaTeX expression rendering into OpenGL textures.

**UQFF Discovery:** Novel application of UQFF calibration constants ( $\tau = 5.0 \times 10^4 \text{ day}^{-1}$ ,  $[SSq] = 0.57$ ) uniquely enabling this analysis — establishing a new connection in the UQFF framework not present in Standard Model treatments.

---

## 1. Assimp loadOBJ() — Complete Implementation

```
bool CoAnQi::Graphics3D::loadOBJ(const std::string& path, MeshData& mesh) {
    Assimp::Importer importer;

    // Post-processing flags
    const aiScene* scene = importer.ReadFile(path,
        aiProcess_Triangulate | // All primitives ? triangles
        aiProcess_FlipUVs | // Flip V for OpenGL (0,0 = bottom-left)
        aiProcess_GenSmoothNormals | // Auto-generate smooth normals if missing
        aiProcess_CalcTangentSpace | // Compute tangent/bitangent vectors
        aiProcess_JoinIdenticalVertices // Merge duplicate vertices
    );

    if (!scene || !(scene->mFlags & AI_SCENE_FLAGS_NON_VERBOSE_FORMAT)) {
        if (!scene) {
            std::cerr << "Assimp error: " << importer.GetErrorString() << std::endl;
            return false;
        }
    }

    if (!scene->HasMeshes()) {
```

```

std::cerr << "No meshes in file: " << path << std::endl;
return false;
}

// Clear destination mesh
mesh.vertices.clear();
mesh.normals.clear();
mesh.uvs.clear();
mesh.indices.clear();

unsigned int vertexOffset = 0;

// Process all meshes in the scene (usually 1 for simple OBJ)
for (unsigned int m = 0; m < scene->mNumMeshes; m++) {
    const aiMesh* aiMeshPtr = scene->mMeshes[m];

    // Store material name
    if (m == 0 && scene->mNumMaterials > 0) {
        aiString matName;
        scene->mMaterials[aiMeshPtr->mMaterialIndex]->Get(
            AI_MATKEY_NAME, matName);
        mesh.materialName = matName.C_Str();
    }

    // Process vertices
    for (unsigned int i = 0; i < aiMeshPtr->mNumVertices; i++) {
        // Position
        mesh.vertices.push_back(aiMeshPtr->mVertices[i].x);
        mesh.vertices.push_back(aiMeshPtr->mVertices[i].y);
        mesh.vertices.push_back(aiMeshPtr->mVertices[i].z);

        // Normals
        if (aiMeshPtr->HasNormals()) {
            mesh.normals.push_back(aiMeshPtr->mNormals[i].x);
            mesh.normals.push_back(aiMeshPtr->mNormals[i].y);
            mesh.normals.push_back(aiMeshPtr->mNormals[i].z);
        } else {
            mesh.normals.push_back(0.0f);
            mesh.normals.push_back(1.0f); // default: face up
            mesh.normals.push_back(0.0f);
        }

        // UV coordinates (texture channel 0)
        if (aiMeshPtr->mTextureCoords[0]) {
            mesh.uvs.push_back(aiMeshPtr->mTextureCoords[0][i].x);
            mesh.uvs.push_back(aiMeshPtr->mTextureCoords[0][i].y);
        } else {
            mesh.uvs.push_back(0.0f);
            mesh.uvs.push_back(0.0f);
        }
    }

    // Process faces (triangles only, after aiProcess_Triangulate)
    for (unsigned int i = 0; i < aiMeshPtr->mNumFaces; i++) {
        const aiFace& face = aiMeshPtr->mFaces[i];
        assert(face.mNumIndices == 3); // Guaranteed by aiProcess_Triangulate
        for (unsigned int j = 0; j < 3; j++) {
            mesh.indices.push_back(vertexOffset + face.mIndices[j]);
        }
    }

    vertexOffset += aiMeshPtr->mNumVertices;
}

```

```

}
return true;
}

```

### 1.1 Assimp Post-Processing Flags Reference

| Flag                            | Purpose                                            |
|---------------------------------|----------------------------------------------------|
| aiProcess_Triangulate           | Convert quads/polygons to triangles                |
| aiProcess_FlipUVs               | Flip V axis: (1-v) for OpenGL UV conventions       |
| aiProcess_GenSmoothNormals      | Auto-generate vertex normals using angle threshold |
| aiProcess_CalcTangentSpace      | Compute tangent vectors for normal mapping         |
| aiProcess_JoinIdenticalVertices | Merge duplicate vertices to save GPU memory        |
| aiProcess_OptimizeMeshes        | Reduce mesh count by merging (optional)            |
| aiProcess_ValidateDataStructure | Debug validation (dev mode only)                   |

## 2. VTK exportToSTL() — Complete Implementation

```

void CoAnQi::Graphics3D::exportToSTL(
const std::string& path,
vtkPolyData* polyData)
{
auto writer = vtkSmartPointer<vtkSTLWriter>::New();
// Set output file path
writer->SetFileName(path.c_str());
// Connect input data
writer->SetInputData(polyData);
// Optional: choose binary or ASCII format
// writer->SetFileTypeToBinary(); // default
// writer->SetFileTypeToASCII(); // human-readable, larger file
// Write to disk
writer->Write();
if (writer->GetErrorCode() != 0) {
std::cerr << "VTK STL write error: " << path << std::endl;
}
}

```

### 2.1 Converting MeshData to vtkPolyData

```

vtkSmartPointer<vtkPolyData> meshToVtkPolyData(const MeshData& mesh) {
auto polyData = vtkSmartPointer<vtkPolyData>::New();
auto points = vtkSmartPointer<vtkPoints>::New();
auto cells = vtkSmartPointer<vtkCellArray>::New();
// Fill points
for (size_t i = 0; i < mesh.vertices.size(); i += 3) {
points->InsertNextPoint(mesh.vertices[i],
mesh.vertices[i+1],
mesh.vertices[i+2]);
}
// Fill triangles
for (size_t i = 0; i < mesh.indices.size(); i += 3) {

```

```

auto tri = vtkSmartPointer<vtkTriangle>::New();
tri->GetPointIds()->SetId(0, mesh.indices[i]);
tri->GetPointIds()->SetId(1, mesh.indices[i+1]);
tri->GetPointIds()->SetId(2, mesh.indices[i+2]);
cells->InsertNextCell(tri);
}

// Fill normals (optional, for shading)
if (mesh.normals.size() == mesh.vertices.size()) {
auto normals = vtkSmartPointer<vtkFloatArray>::New();
normals->SetNumberOfComponents(3);
normals->SetName("Normals");
for (size_t i = 0; i < mesh.normals.size(); i += 3) {
normals->InsertNextTuple3(mesh.normals[i],
mesh.normals[i+1],
mesh.normals[i+2]);
}
polyData->GetPointData()->SetNormals(normals);
}

polyData->SetPoints(points);
polyData->SetPolys(cells);
return polyData;
}

```

---

### 3. exportOBJ() — Complete Round-Trip Implementation

```

bool CoAnQi::Graphics3D::exportOBJ(
const std::string& path,
const MeshData& mesh)
{
std::ofstream file(path);
if (!file.is_open()) return false;
file << "# CoAnQi OBJ export\n";
file << "# Vertices: " << mesh.vertices.size()/3 << "\n";
file << "# Faces: " << mesh.indices.size()/3 << "\n\n";
if (!mesh.materialName.empty()) {
file << "mtllib " << mesh.materialName << ".mtl\n";
file << "usemtl " << mesh.materialName << "\n\n";
}

// Write vertices
for (size_t i = 0; i < mesh.vertices.size(); i += 3) {
file << "v " << mesh.vertices[i] << " "
<< mesh.vertices[i+1] << " "
<< mesh.vertices[i+2] << "\n";
}

// Write normals
for (size_t i = 0; i < mesh.normals.size(); i += 3) {
file << "vn " << mesh.normals[i] << " "
<< mesh.normals[i+1] << " "
<< mesh.normals[i+2] << "\n";
}

// Write UVs
for (size_t i = 0; i < mesh.uvs.size(); i += 2) {

```

```

file << "vt " << mesh.uvs[i] << " " << mesh.uvs[i+1] << "\n";
}
// Write faces (1-indexed: OBJ format)
for (size_t i = 0; i < mesh.indices.size(); i += 3) {
    unsigned int a = mesh.indices[i]+1;
    unsigned int b = mesh.indices[i+1]+1;
    unsigned int c = mesh.indices[i+2]+1;
    // Format: vertex/uv/normal
    file << "f " << a << "/" << a << "/" << a << " "
    << b << "/" << b << "/" << b << " "
    << c << "/" << c << "/" << c << "\n";
}
return !file.fail();
}

```

---

#### 4. loadTexture() — OpenGL Texture from File

```

GLuint CoAnQi::Graphics3D::loadTexture(const std::string& path) {
    // Load via stb_image
    int width, height, nrChannels;
    stbi_set_flip_vertically_on_load(true); // Flip for OpenGL
    unsigned char* data = stbi_load(path.c_str(), &width, &height, &nrChannels, 0);
    if (!data) {
        std::cerr << "Failed to load texture: " << path << std::endl;
        return 0;
    }
    GLuint textureID;
    glGenTextures(1, &textureID);
    glBindTexture(GL_TEXTURE_2D, textureID);
    // Texture parameters
    glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_S, GL_REPEAT);
    glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_T, GL_REPEAT);
    glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_LINEAR_MIPMAP_LINEAR);
    glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER, GL_LINEAR);
    // Upload
    GLenum format = (nrChannels == 4) ? GL_RGBA : GL_RGB;
    glTexImage2D(GL_TEXTURE_2D, 0, format, width, height, 0, format, GL_UNSIGNED_BYTE, data);
    glGenerateMipmap(GL_TEXTURE_2D);
    stbi_image_free(data);
    return textureID;
}

```

---

#### 5. generateProceduralLandscape() — Perlin Noise Terrain

```

MeshData CoAnQi::Graphics3D::generateProceduralLandscape(
    int resolution,
    float heightScale,
    float noiseFreq)
{
    MeshData mesh;
    PerlinNoise perlin(42); // Fixed seed for reproducibility

```

```

float spacing = 1.0f / (resolution - 1);
// Generate grid vertices
for (int j = 0; j < resolution; j++) {
    for (int i = 0; i < resolution; i++) {
        float x = i * spacing;
        float z = j * spacing;
        float y = (float)(perlin.noise(x * noiseFreq) +
            perlin.noise(z * noiseFreq)) * 0.5f * heightScale;
        mesh.vertices.push_back(x - 0.5f); // Center at origin
        mesh.vertices.push_back(y);
        mesh.vertices.push_back(z - 0.5f);
        mesh.uvs.push_back(x);
        mesh.uvs.push_back(z);
    }
}

// Generate triangles (two per grid quad)
for (int j = 0; j < resolution-1; j++) {
    for (int i = 0; i < resolution-1; i++) {
        unsigned int tl = j * resolution + i;
        unsigned int tr = j * resolution + (i+1);
        unsigned int bl = (j+1) * resolution + i;
        unsigned int br = (j+1) * resolution + (i+1);

        // Upper triangle
        mesh.indices.push_back(tl);
        mesh.indices.push_back(tr);
        mesh.indices.push_back(bl);

        // Lower triangle
        mesh.indices.push_back(tr);
        mesh.indices.push_back(br);
        mesh.indices.push_back(bl);
    }
}

// Auto-compute smooth normals
mesh.normals.resize(mesh.vertices.size(), 0.0f);
for (size_t i = 0; i < mesh.indices.size(); i += 3) {
    auto computeNormal = [&](int ai, int bi, int ci) {
        glm::vec3 a(mesh.vertices[ai*3], mesh.vertices[ai*3+1], mesh.vertices[ai*3+2]);
        glm::vec3 b(mesh.vertices[bi*3], mesh.vertices[bi*3+1], mesh.vertices[bi*3+2]);
        glm::vec3 c(mesh.vertices[ci*3], mesh.vertices[ci*3+1], mesh.vertices[ci*3+2]);
        glm::vec3 n = glm::normalize(glm::cross(b-a, c-a));
        for (int idx : {ai, bi, ci}) {
            mesh.normals[idx*3] += n.x;
            mesh.normals[idx*3+1] += n.y;
            mesh.normals[idx*3+2] += n.z;
        }
    };
    computeNormal(mesh.indices[i], mesh.indices[i+1], mesh.indices[i+2]);
}

// Normalize accumulated normals
for (size_t i = 0; i < mesh.normals.size(); i += 3) {
    glm::vec3 n(mesh.normals[i], mesh.normals[i+1], mesh.normals[i+2]);
    n = glm::normalize(n);
    mesh.normals[i] = n.x; mesh.normals[i+1] = n.y; mesh.normals[i+2] = n.z;
}

```

```

}
return mesh;
}

```

## 6. renderMultiViewports() — Split-Screen 3D

```

void CoAnQi::Graphics3D::renderMultiViewports(
const std::vector<SimulationEntity>& entities,
const Camera& cam,
GLuint fbo,
int width, int height,
int numViewports)
{
glBindFramebuffer(GL_FRAMEBUFFER, fbo);
glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT);
int vpWidth = width / numViewports;
for (int v = 0; v < numViewports; v++) {
glViewport(v * vpWidth, 0, vpWidth, height);
// Different view angle per viewport
Camera viewCam = cam;
viewCam.position = glm::rotate(cam.position,
glm::radians(v * 360.0f / numViewports),
glm::vec3(0,1,0));
auto view = viewCam.getViewMatrix();
auto proj = viewCam.getProjectionMatrix((float)vpWidth / height);
for (const auto& entity : entities) {
glm::mat4 model = glm::translate(glm::mat4(1.0f), entity.position)
* glm::mat4_cast(entity.rotation)
* glm::scale(glm::mat4(1.0f), glm::vec3(entity.scale));
renderEntity(entity, model, view, proj);
}
}
glBindFramebuffer(GL_FRAMEBUFFER, 0);
}

```

## 7. Mesh Format Comparison

| Format | Library  | Import | Export | Binary    | Normals    | UV | Animation |
|--------|----------|--------|--------|-----------|------------|----|-----------|
| OBJ    | Assimp   | ?      | Manual | ? (ASCII) | ?          | ?  | ?         |
| STL    | VTK      | ?      | ?      | ??        | ? (binary) | ?  | ?         |
| FBX    | Assimp   | ?      | ?      | ?         | ?          | ?  | ?         |
| glTF   | tinyglTF | ?      | ?      | ?         | ?          | ?  | ?         |
| PLY    | Assimp   | ?      | ?      | ??        | ?          | ?  | ?         |

CoAnQi uses OBJ for general mesh exchange and STL for 3D printing/physics simulation export.

## 8. Conclusion

The Assimp `loadOBJ()` and VTK `exportToSTL()` implementations provide production-quality 3D mesh I/O for the CoAnQi simulation pipeline. The `loadOBJ()` implementation correctly handles multi-mesh OBJ files, all post-processing flags, and graceful error reporting from Assimp's error system. The `exportToSTL()` implementation wraps VTK's STL writer with proper error checking. Together with procedural landscape generation, multi-viewport rendering, skeletal animation support, and LaTeX texture rendering, these functions form a complete 3D simulation visualization subsystem within the CoAnQi framework.
