Abstract

This paper catalogs the second major group of *FUBii variants from the BBCEquations04Sept2025.pdf* (177-page equation catalogue): cosmological and dark sector buoyancy forces. Covered are anyon systems, dark energy, inflation, gravitational waves, Loop Quantum Cosmology (LQC) bounce and perturbation spectra, Bekenstein-Hawking entropy, Hawking evaporation lifetime, reheating, Big Bang Nucleosynthesis, reionization, baryon-photon ratio, convective turnover time, CMB angular power spectrum, recombination, NFW dark matter profiles, SIDM core formation, void density evolution, and peculiar velocity. Each *FUBii,X* form uses the universal *Frel/ELEP* scaling with a system-specific physical expression *FX*.

UQFF Discovery: Novel application of UQFF calibration constants ($? = 5.0 \times 10^{-4} \text{ day}^1$, $[SSq] = 0.57$) uniquely enabling this analysis — establishing a new connection in the UQFF framework not present in Standard Model treatments.
