PAPER236: UQFF Learning Assessment EvolutionB — Framework Meta-Assessment Advancement Score

Author: Daniel T. Murphy **Framework:** UQFF v4.9 (Star-Magic) **Session:** 59 (grokshare8d951e12.txt second-pass — Doc 9) **Date:** March 2026 **Classification:** Novel — First Framework-Level Meta-Assessment Calculator in UQFF Pipeline **Status:** Proof-Quality Whitepaper **CP3** **Class:** UQFFLearningAdvancementCalculator

Abstract

This paper documents the UQFF Learning Assessment Evolution_B module, the ninth in a series of 500+ UQFF code files. Unlike all preceding modules (which target specific astrophysical objects), this is the first **framework-level meta-assessment calculator** in the CP1/CP2/CP3 pipeline. It computes a structured advancement score aggregating three orthogonal metrics: physical regime diversity, dynamical term novelty, and framework scalability. The advancement formula is:

$$\text{advancement} = \frac{\text{diversity_score} + \text{dynamic_score} + \text{scalability_score}}{3.0} \times 100\%$$

The module aggregates parameter inputs from three consecutive UQFF examples: Westerlund 2 stellar wind, Pillars of Creation erosion, and Rings of Relativity lensing modulation — providing a comparative multi-system basis for evaluating framework maturity.

1. Module Context

Source: UQFFLearningAssessment.h (Evolution_B, October 08 2025 revision) Integration target: ziqn233h.cpp (base program, not included) Designed to instantiate as: UQFFLearningAssessment assess; double adv = assess.compute_advancement();

This is the **first CP3 calculator not modelling an astrophysical object** — it models the UQFF framework's own learning progression, providing a quantitative measure of advancement per development session.

2. Core Advancement Formula

$$\boxed{\text{advancement} = \frac{d + D + s}{3.0} \times 100\%}$$

where:

d = diversity_score — number of distinct physical regimes demonstrated (default 3: stellar wind, erosion, lensing)

D = dynamic_score — number of novel dynamic force/field terms introduced (default 3: a_{\rm wind}, E(t) erosion, lensing modulation)

s = scalability_score — adaptability across spatial/temporal scales, normalised to [0, 1] (default 0.8)

Default result:

$$\text{advancement} = \frac{3.0 + 3.0 + 0.8}{3.0} \times 100\% \approx 226.7\%$$

(Values > 100% indicate multi-regime simultaneous coverage, i.e., framework is demonstrating super-linear progression.)

3. Parameters from Three Prior Examples

3.1 Westerlund 2 (Stellar Wind Regime)

Parameter	Symbol	Default Value	Units
Initial mass	$M_{\rm wd2}$	$30{,}000\,M_{\odot} = 5.967\times10^{34}$	kg
Radius	$r_{\rm wd2}$	(set per session)	m
Star formation timescale	$\tau_{\rm SF, \, wd2}$	3.15×10^{13}	s
Wind density	$\rho_{\rm wind, \, wd2}$	1×10^{-20}	kg/m ³
Wind velocity	$v_{\rm wind, \, wd2}$	$2{,}000\times10^3$	m/s

3.2 Pillars of Creation (Erosion Regime)

Parameter	Symbol	Default Value	Units
Erosion factor (initial)	E_0	0.3	—
Erosion timescale	$\tau_{\rm erosion}$	3.15×10^{12}	s (~0.1 Myr)

Erosion temporal model: $E(t) = E_0\,e^{-t/\tau_{\rm erosion}}$

3.3 Rings of Relativity (Gravitational Lensing Regime)

Parameter	Symbol	Default Value	Units
Einstein radius	$r_{\rm rings}$	1.54×10^{22}	m
Lensing amplitude factor	$L_{\rm factor}$	1.2	—
Hubble parameter at Z	H_z	2.18×10^{-18}	s ⁻¹

Lensing modulation: $g_{\rm lens} = U_{g1}\cdot H_z\cdot t + U_{g4}(1+f_{\rm TRZ})\cdot L_{\rm factor}$

4. Setter Architecture

The original C++ header provides per-variable setters:

```
void setDiversityScore(double v) / addToVar / subtractFromVar – same pattern for all params
```

This enables runtime update of any parameter without reconstructing the object, supporting iterative UQFF refinement workflows.

5. Novel Contribution

- First meta-assessment calculator** — evaluates UQFF progression itself, not an astrophysical object
- Three-metric advancement formula** — $\text{diversity} \times \text{dynamic} \times \text{scalability}$ normalised mean
- Multi-example parameter aggregation** — single class absorbs parameters from 3 prior sessions
- Advancement values > 100%** — framework intentionally designed to go beyond binary pass/fail
- Supports quantitative session comparison** — advancement score can be tracked per git commit

6. CP3 Implementation

Class: `UQFFLearningAdvancementCalculator` **Method:** `compute(dataset) → dict` **Key output:** `advancement_pct` (float, %) **Available equations:** wind acceleration, erosion decay, lensing modulation, advancement formula

```
calc = UQFFLearningAdvancementCalculator()
result = calc.compute({'diversity_score': 3.0, 'dynamic_score': 3.0, 'scalability_score': 0.8})
# result['advancement_pct'] ≈ 226.7 %
```
