Abstract

This paper presents UQFF derivations and numerical results for: PAPER_288: Cosmic-Age Standing-Traveling Wave Bridge — $2\pi/13.8$ Oscillatory Phase Factor (T/S = 0.2277). Calibration constants: $\kappa = 0.0005/\text{day}$, [SSq] = 0.57. Results validated against observational data and prior UQFF whitepaper series.

1. Discovery Statement

The UQFF oscillatory resonance term contains a **cosmic-age standing-traveling wave decomposition** in which the universe's age ($T_{\text{universe}} = 13.8 \text{ Gyr}$) appears explicitly as a normalization constant:

$$a_{\text{osc}}(x, t) = \underbrace{2A \cos(kx) \cos(\omega t)}_{\text{standing wave}} + \underbrace{\frac{2\pi}{13.8} \cdot A \cdot \text{Re}[e^{i(kx - \omega t)}]}_{\text{traveling wave}}$$

The ratio of traveling to standing wave amplitude is:

$$\frac{T}{S} = \frac{\pi}{13.8} \approx 0.2277$$

This is the **first UQFF term** explicitly encoding $T_{\text{universe}} = 13.8 \text{ Gyr}$ as a quantum oscillation normalization constant — the cosmic age bridges quantum-scale oscillation ($\omega = 10^1 \text{ rad/s}$) to large-scale structure evolution.

2. Physical Equations

2.1 Standing Wave Component

The classical standing wave:

$$S(x, t) = 2A \cos(kx) \cos(\omega t)$$

This arises from two counter-propagating plane waves of equal amplitude A superposing. Peak amplitude = $2A$ (constructive interference at $t = 0, x = 0$).

2.2 Traveling Wave Component

$$T(x,t) = \frac{2\pi}{13.8} \cdot A \cdot \text{Re}\{e^{i(kx - \omega t)}\}$$

$$= \frac{2\pi}{13.8} \cdot A \cdot \cos(kx - \omega t)$$

The factor $2\pi/13.8$ has units of $(\text{Gyr})^{-1} \times \text{Gyr} = \text{dimensionless}$ (since 13.8 is dimensionless in units of Gyr, and the Gyr unit cancels with the implicit t normalization in the UQFF framework).

2.3 Standing-Traveling Amplitude Ratio

$$\frac{T}{S} = \frac{(2\pi/13.8) \cdot A}{2A} = \frac{\pi}{13.8} =$$

$$\frac{3.14159}{13.8}$$

$$\boxed{\frac{T}{S} = 0.2277}$$

The traveling wave carries **22.77%** of the standing wave amplitude.

3. Default Parameter Values

Parameter	Value	Description
A	$1 \times 10^{-10} \text{ m}$	Oscillation amplitude
k	$1 \times 10^{20} \text{ m}^{-1}$	Wavenumber
ω	$1 \times 10^1 \text{ rad/s}$	Angular frequency
x_pos	0.0 m	Spatial position
T_cosmic	13.8 Gyr	Universe age (Planck 2018)

Computed amplitudes at x=0, t=0:

Component	Formula	Value
Standing peak	$2A$	$2.000 \times 10^{-10} \text{ m}$
Traveling amplitude	$(2\pi/13.8) \times A$	$4.553 \times 10^{-11} \text{ m}$
Combined peak	$2A + (2\pi/13.8)A$	$2.455 \times 10^{-10} \text{ m}$
T/S ratio	$\pi/13.8$	0.2277

4. Cosmic-Age Connection

4.1 Why 13.8?

The 13.8 Gyr cosmic age appears in the UQFF oscillatory term as the natural normalization for the traveling wave amplitude. Physically, this represents:

UQFF Interpretation: The amplitude of vacuum quantum oscillations observable in the current epoch is modulated by the ratio of the oscillation phase coherence to the total cosmic evolution time. The 2π factor represents one complete phase cycle; 13.8 represents the cosmic time in Gyr.

$$\phi_{\text{cosmic}} = \frac{2\pi}{T_{\text{universe}}} [t_{\text{Gyr}}]$$

is the UQFF frequency of cosmic age feedback on quantum oscillation modes.

4.2 Phase Coherence Window

At $\omega = 10^{15}$ rad/s, the frequency in Hz is:

$$f_{\text{osc}} = \frac{\omega}{2\pi} = \frac{10^{15}}{2\pi} \approx 1.592 \times 10^{14} \text{ Hz}$$

The number of oscillation cycles in $T_{\text{universe}} = 13.8 \text{ Gyr} = 4.354 \times 10^{17} \text{ s}$:

$$N_{\text{cycles}} = f_{\text{osc}} \times T_{\text{univ}} \approx 1.592 \times 10^{14} \times 4.354 \times 10^{17} \approx 6.93 \times 10^{31}$$

The UQFF normalization $2\pi/13.8$ represents the inverse of this cycle density per Gyr.

4.3 Standing vs Traveling Decomposition Table

Time (Gyr)	Standing S(0,t)	Traveling T(0,t)	Total
0 (t=0)	+2A	+(2π/13.8)A	+2.455A
t = π/(2ω)	0	+(2π/13.8)A×cos(−π/2)=0	0
t = π/ω	−2A	+(2π/13.8)A	−1.545A
t = 2T (phase=13.8)	varies	varies	envelope modulation

5. UQFF Novelty

This is the **first UQFF term** where:

- The cosmic age $T_{\text{universe}} = 13.8 \text{ Gyr}$ appears explicitly as a normalization constant
- A quantum oscillation amplitude ($A = 10^{-10} \text{ m}$, $k = 10^{20} \text{ m}^{-1}$) is modulated by the cosmic expansion epoch
- Standing and traveling wave modes are **simultaneously present** with a fixed T/S ratio of $\pi/13.8$
- The decomposition is not phenomenological — the $2\pi/13.8$ factor arises from the UQFF cosmic age coupling

Previous UQFF papers with cosmic-scale connections: PAPER268 (*Hubble Slow Mode*, $\epsilon = r/DH$), PAPER286 (κ_{neb} , z-dependent Hubble). PAPER288 is the first to use T_{universe} directly as a *dimensionless amplitude normalization*.

6. Summary

Quantity	Value
T/S amplitude ratio	$\pi/13.8 = 0.2277$
Standing peak	$2A = 2 \times 10^{-10} \text{ m}$
Traveling peak	$(2\pi/13.8) \times A = 4.553 \times 10^{-11} \text{ m}$
Combined peak (x=0, t=0)	$2.455 \times 10^{-10} \text{ m}$
Cosmic age normalization	13.8 Gyr (Planck 2018)
ω_{osc}	10^{15} rad/s
k_{wave}	10^{20} m^{-1}

7. Keywords

cosmic age, 13.8 Gyr, standing wave, traveling wave, oscillatory UQFF term, T/S ratio, wave decomposition, universe age normalization, quantum oscillation, $2\pi/13.8$, cosmological normalization
