Abstract

This paper presents the complete 12-term FUBii integrand in verbatim form. Prior pipeline whitepapers (PAPER198 through PAPER256) documented the FUBii framework with the first five terms (vacuum repulsion, DPM momentum, DPM gravity, DPM stability, LENR phonon). This paper formally defines Terms 6–12 which were first revealed in the September 14, 2025 Grok 4 deep-analysis thread: k_{act} cosine activity coupling, $k_{DE} \times LX$ dark energy–luminosity product, Zeeman magnetic coupling, $k_{neutron} \times s_n$ neutron cross-section term, relativistic center-of-mass correction, F_{Sweet} vacuum ($\sim 10^3$? N, negligible), and F_{Kozima} neutron drop ($\sim 10^3$ – 10^{33} N, the dominant new-term contribution). These seven new terms complete the FUBii force integrand to full 12-term status.

2. Complete 12-Term Integrand

2.1 Master Equation

$$\begin{aligned} F_{UBii} = & \theta^{x_2} [-F_0 \\ & + (m_e c^2 / r^2) \cdot DPM_{momentum} \cdot \cos \theta \\ & + (G M / r^2) \cdot DPM_{gravity} \\ & + \theta_{vac,UA} \cdot DPM_{stability} \\ & + k_{LENR} \cdot (\theta_{LENR} / \theta_0)^2 \\ & + k_{act} \cdot \cos(\theta_{act} \cdot t) \\ & + k_{DE} \cdot L_X \\ & + 2q B_0 V \sin \theta \cdot (g \mu_B B_0 / \theta_0) \\ & + k_{neutron} \cdot s_n \\ & + k_{rel} \cdot (E_{cm,adj} / E_{cm})^2 \\ & + F_{Sweet,vac} \end{aligned}$$

3. Term-by-Term Reference (Verbatim from Thread)

Term 1: Vacuum Repulsion Floor

-F_0

F_0 = 10¹⁰ N (vacuum repulsion floor)
Sets the baseline repulsive floor preventing singularity at r=0
Always negative (repulsive)

Term 2: DPM Momentum Coupling

(m_e c^2 / r^2) · DPM_momentum · cos θ

m_e c^2 = 8.19×10⁻¹⁴ J (electron rest energy)
DPM_momentum = dark photon momentum coupling factor
cos θ: angular projection onto integration axis

Term 3: DPM Gravitational Coupling

(G M / r^2) · DPM_gravity

Standard Newtonian gravity modified by DPM factor
DPMgravity ~ fUA' × f_Scm × REB (Resonant Energy Bridge factor)
For Cen A: G×1.1e38 kg/r² ~ 7.33×10⁻⁴ m/s²

Term 4: DPM Vacuum Stability

ρ_vac,[UA] · DPM_stability

ρ_vac,[UA] ~ 10⁻³⁰ kg/m³ (aether vacuum density)
DPM_stability = stability factor from vacuum density modulation

Term 5: LENR Phonon Coupling

k_LENr · (ω_LENr / ω_0)^2

k_LENr ~ 10⁻¹⁰ (phonon coupling constant)
ω_LENr = 7.85×10¹² rad/s (Colman-Gillespie 1.25 THz)
ω_0 = 10⁻¹⁵ rad/s (system reference frequency)
Ratio = (7.85×10¹²/10⁻¹⁵)² = 6.16×10⁵⁴ ? dominant LENR driver

Term 6: Activity Coupling (NEW)

k_act · cos(ω_act · t)

Symbol	Value	Description
k_act	10 ²⁵	Activity coupling amplitude (calibrated from Chandra)
ω_act	2p/(12.5 yr) for Cen A	Activity angular frequency
	~2p/days for Sgr A* JWST mid-IR	

Symbol	Value	Description
	~2p/weeks for M87 jet variable	

Physical significance:

Cen A: V-shape jet hit Dec 2024 ? t_jet ~ 12.5 yr activity cycle
Sgr A*: JWST mid-IR flares Jan–Feb 2025 ? ?_act ~ 1/day
M87: jet variability weeks–months
Captures periodic AGN jet activity injection into FUBi_i

Code (verified):

```
k_act = 1e-5 # from 12.5 yr variability
omega_act_t = np.cos(2*np.pi*x / (12.5 * 3.156e7)) # yr to s
```

Term 7: Dark Energy–Luminosity Product (NEW)

$k_{DE} \cdot L_X$

Symbol	Value	Description
k_DE	$10^{?2\circ} \text{ m}^{?1}$	Dark energy coupling to X-ray luminosity
L_X	~104° W (Cen A)	X-ray luminosity

Product: $k_{DE} \times L_X \sim 10^{?2\circ} \times 104^\circ = 10^{2\circ} \text{ N/m}$ Integrated over x_2: contribution ~104³ N for galactic-class systems

Physical significance: Connects cosmological dark energy (via k_DE with ? dimension) to the local X-ray radiative output of AGN systems.

Term 8: Zeeman Magnetic Coupling (NEW)

$2q B_0 V \sin ? \cdot (g \mu_B B_0 / ? ?_0)$

Symbol	Value	Description
q	$1.6 \times 10^{?1} ? \text{ C}$	Electric charge
B0	1 G = 10 ^{?4} T (Cen A); 4.2 G (Jupiter); 1–30 G (Crab)	Magnetic field
V	$10^{?3} \text{ m}^3$	Reference volume element
sin ?	sinusoidal along integration path	Angular factor
g	g-factor (~2)	Electron g-factor
μ_B	$9.274 \times 10^{?24} \text{ J/T}$	Bohr magneton
?	$1.0546 \times 10^{?34} \text{ J}\cdot\text{s}$	Reduced Planck constant
?_0	10^{12} rad/s	Reference THz frequency

Code (verified):

```
g_muB = 9.274e-24 # J/T
hbar = 1.0546e-34
omega0 = 1e12
term_mag = 2*q*B0*V*np.sin(np.pi*x/1e23) * (g_muB*B0/(hbar*omega0))
```

Result: term_mag ~ 10^{?2°} N (subdominant for galactic fields, dominant for magnetar B~10¹¹ T)

Physical significance:

Encodes full Zeeman coupling of charged particles to the vacuum magnetic field

At magnetar $B_0 = 4.4 \times 10^{13}$ T (B_{crit}): *termmag* becomes dominant

Connects to g-2 measurement: $a = (g-2)/2 = 4.74 \times 10^{-5}$ from g-2 fit

Term 9: Neutron Cross-Section Coupling (NEW)

$k_{neutron} \cdot s_n$

Symbol	Value	Description
$k_{neutron}$	$\sim 10^{30}$ (compact)	Neutron flux-coupling constant
s_n	$\sim 10^{28} \text{ m}^2$ (barns range)	Neutron cross-section

Product: $k_{neutron} \times s_n \sim 10^{30} \times 10^{28} = 1 \text{ N}$ (per unit path) Integrated: $\sim 10^{23} \text{ N}$ for compact-class pulsars

Physical significance: Direct nuclear neutron interaction term — connects macroscopic gravity integral to nuclear neutron cross-section. Most significant for neutron stars (s_n enhanced to $\sim 10^{28} \text{ m}^2$ at resonance energies).

Term 10: Relativistic Center-of-Mass Correction (NEW)

$k_{rel} \cdot (E_{cm,adj} / E_{cm})^2$

Symbol	Description
k_{rel}	relativistic correction coupling constant
$E_{cm,adj}$	adjusted CM energy (accounting for UQFF vacuum effects)
E_{cm}	reference CM energy (standard Newtonian/SR)

Variant labels in thread: *Ecm,astro,local,adj,eff,enhanced* / *Ecm* — these suffixes represent the successive relativistic refinements applied to the energy ratio.

Physical significance: When $E_{cm,adj} > E_{cm}$ (vacuum enhancement), this term adds an attractive correction. When $E_{cm,adj} < E_{cm}$ (dense matter suppression), it reduces *FUBi_i*.

Term 11: Sweet Vacuum Energy (NEW — Negligible)

$F_{Sweet,vac} \sim 10^{32} \text{ N}$ [explicit parameterization]

Physical significance: Named after the Sweet vacuum energy formulation. Orders 10^{32} N makes this term negligible compared to all other terms. However, it is explicitly parameterized (not dropped) to:

- Maintain dimensional completeness of the 12-term sum
- Provide a register for future refinement if vacuum energy precision changes
- Serve as the "cosmological constant" analog in the force integrand

Term 12: Kozima Neutron Drop (NEW — Dominant Among New Terms)

$F_{Kozima,neutron_drop} \sim 10^{30} - 10^{33} \text{ N}$

Physical significance:

Named after the Kozima LENR model of phonon-mediated neutron formation

At $\sim 10^{30} \text{ N}$: comparable to *F_LEN*R phonon term (Term 5)

At $\sim 10^{33}$ N; exceeds F_{LENR} by 3 orders, becoming the second-dominant term after $k_{LENR} \times (F_{LENR}/\tau_0)^2$

The neutron drop mechanism: $n \rightarrow p + e^- + \bar{\nu}_e$ with phonon mediation releases energy at the neutron drop scale

Connection to $f_{Heaviside}$ (PAPER329): F_{Kozima} activates exactly when $f_{Heaviside} = 1$ ($sn > scrit$)
