Date: 2026

CP4 Class: #349 — M16EagleNebulaStarsUQFFCalculator

Abstract

M16 (Eagle Nebula, NGC 6611) hosts the iconic “Pillars of Creation” — three densely molecular gas pillars 4–5 light-years long where young stars form under intense UV radiation from nearby O-type stars. Located ~6,500 light-years away, M16 is a key laboratory for studying simultaneous star formation and radiation erosion. This paper derives the Master Universal Gravity UQFF equation incorporating gravitational attraction, star formation mass growth, radiation photoevaporation, cosmic expansion, and [UA]/[SCm] Aether correction. The result $g_{M16} \approx 1.053 \times 10^{-3} \text{ m/s}^2$ is dominated by the Aether electromagnetic term.

1. Introduction

Hubble’s 2014 revisit to M16’s “Pillars of Creation” (visible + infrared) captures embedded protostars and wispy gas structures being eroded by radiation from O-type stars ($\sim 10^5 L_{\odot}$). The pillars are estimated to survive only a few million years before complete photoevaporation. The UQFF framework models the balance between gravitational collapse (driving star formation) and radiation erosion (destroying the pillars) through four multiplicative correction terms, plus the dominant Aether electromagnetic vacuum energy contribution.

2. Master UQFF Gravity Equation

$$g_{M16}(r, t) = (G * M) / r^2 * (1 + H(z)*t) * (1 + M_{sf}(t)) * (1 - E_{rad}(t)) * (1 + f_{TRZ}) + q*(v \times B) * (1 + \rho_{vac,[UA]} / \rho_{vac,[SCm]}) * 10^{-12}$$

2.1 Parameters

Parameter	Symbol	Value	Source
Region total mass	M	1,200 $M_{\odot} = 2.387 \times 10^{33} \text{ kg}$	Labs
Region radius ($\frac{1}{2}$ span)	r	$3.31 \times 10^{17} \text{ m}$ (~35 ly)	Hubble
Redshift	z	0.0015	Distance calc

Parameter	Symbol	Value	Source
Star age	t	$5 \times 10^6 \text{ yr} = 1.578 \times 10^{14} \text{ s}$	Hubble
Star formation rate	SFR	$1 \text{ M}_{\odot}/\text{yr}$	Labs
Initial mass	M_0	$1,200 \text{ M}_{\odot}$	—
Erosion amplitude	E_0	0.3 (30% mass loss)	Labs
Erosion timescale	τ_{erode}	$3 \times 10^6 \text{ yr} = 9.468 \times 10^{13} \text{ s}$	Hubble
Gas velocity	v	10^5 m/s	Labs
Nebular B field	B	10^{-5} T	Labs
$\rho_{\text{vac}}[\text{UA}]$	—	$7.09 \times 10^{-36} \text{ J/m}^3$	UQFF
$\rho_{\text{vac}}[\text{SCm}]$	—	$7.09 \times 10^{-37} \text{ J/m}^3$	UQFF
f_TRZ	—	0.1	UQFF

3. Long-Form Derivation

Step 1: Base Gravitational Term

$$\begin{aligned} g_{\text{grav}} &= (6.6743\text{e-}11 \times 2.387\text{e}33) / (3.31\text{e}17)^2 \\ &= 1.593\text{e}23 / 1.096\text{e}35 = 1.454\text{e-}12 \text{ m/s}^2 \end{aligned}$$

Step 2: Star Formation Mass Growth

$$\begin{aligned} M_{\text{sf}}(t) &= \text{SFR} \times t / M_0 = 1 \times 5\text{e}6 / 1200 = 4167 \\ (\text{normalized}) \quad 1 + M_{\text{sf}}(t) &= 1 + (4167/1200) = 1 + 3.472 = 4.472 \end{aligned}$$

Step 3: Radiation Erosion

$$\begin{aligned} t / \tau_{\text{erode}} &= 1.578\text{e}14 / 9.468\text{e}13 = 1.667 \\ E_{\text{rad}}(t) &= 0.3 \times (1 - \exp(-1.667)) = 0.3 \times (1 - 0.1889) = 0.3 \times 0.8111 = 0.2433 \\ 1 - E_{\text{rad}}(t) &= 0.7567 \end{aligned}$$

Step 4: Cosmic Expansion

$$\begin{aligned} H(z) &= 70 \times \sqrt{0.3 \times (1.0015)^3 + 0.7} = 70.047 \text{ km/s/Mpc} \\ H(z) &= 70.047\text{e}3 / 3.086\text{e}22 = 2.269\text{e-}18 \text{ s}^{-1} \\ H(z) \times t &= 2.269\text{e-}18 \times 1.578\text{e}14 = 3.581\text{e-}4 \\ 1 + H(z) \times t &= 1.0003581 \end{aligned}$$

Step 5: Time-Reversal Correction

$$1 + f_{\text{TRZ}} = 1.1$$

Step 6: Electromagnetic [UA] Term

$$\begin{aligned} q \times (v \times B) &= 1.602\text{e-}19 \times 1\text{e}5 \times 1\text{e-}5 = 1.602\text{e-}19 \text{ N} \\ a &= 1.602\text{e-}19 / 1.673\text{e-}27 = 9.575\text{e}7 \text{ m/s}^2 \end{aligned}$$

$$(1 + \rho_{\text{vac, [UA]}}/\rho_{\text{vac, [SCm]}}) = 11$$

$$\text{Total} = 9.575\text{e}7 \times 11 \times 10^{-12} = 1.053\text{e}-3 \text{ m/s}^2$$

Step 7: Final Solution

$$\begin{aligned} g_{\text{M16}} &= (1.454\text{e}-12) \times (1.0003581) \times (4.472) \times (0.7567) \times (1.1) + 1.053\text{e}-3 \\ &= 5.413\text{e}-12 + 1.053\text{e}-3 \\ &\approx 1.053\text{e}-3 \text{ m/s}^2 \end{aligned}$$

4. Physical Interpretation

The M16 Pillars of Creation sit in dynamic equilibrium: star formation mass growth ($\times 4.472$) and radiation erosion ($\times 0.7567$) compete across the pillar structures. The star formation term amplifies effective gravity by $4.5\times$, while radiation removes 24% of this through photoevaporation. The net gravitational term ($5.413\times 10^{-12} \text{ m/s}^2$) is overwhelmed by the Aether [UA] electromagnetic term ($1.053\times 10^{-3} \text{ m/s}^2$), confirming non-standard vacuum energy dominates M16's UQFF dynamics.

5. UQFF Framework Advancement

- Captures simultaneous star formation + radiation erosion as competing UQFF multipliers
 - M_{sf} factor of 4.472 shows star formation's amplifying effect on effective gravity
 - Radiation erosion (0.7567) provides UQFF with a natural destruction/creation balance parameter
 - Validates UQFF for radiation-dominated star-forming nebulae at 6,500 ly
-

6. Conclusions

The Master UQFF gravity equation for M16 yields $g_{\text{M16}} \approx 1.053\times 10^{-3} \text{ m/s}^2$, demonstrating that the Aether electromagnetic term (1.053×10^{-3}) exceeds the classical+corrections gravitational term (5.413×10^{-12}) by nine orders of magnitude. The competing star formation growth and radiation erosion multipliers provide a rich UQFF representation of the Pillars of Creation's dynamic equilibrium.
