§1 Abstract

The Universal Gaussian Buoyancy modulator $F_{U,Bi,i}$ — a Gaussian-weighted projection of the Universal Field Equation — prevents gravitational collapse in all astronomical systems by maintaining strictly positive eigenvalues in the UQFF compressed tensor and a bounded integral over all frequencies. This paper presents the complete three-part proof: (I) the eigenvalue positivity condition, (II) the anti-collapse gradient theorem, and (III) the bounded integral theorem. Together these prove that neither Newtonian point-mass collapse nor Einsteinian spacetime singularities are allowed within the UQFF framework. The Buoyancy Harmonics (BH26) number system manifests through the Gaussian frequency bins at VLA/ALMA emission frequencies.

§2 The F_U_Bi_i Formula

The Universal Gaussian Buoyancy modulator is defined as:

$$F_{U,Bi,i} = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right) \cdot F_U$$

where:

- σ = frequency variance of the observational dataset (default: 10^{16} Hz from ALMA ensemble)
- μ = dataset mean frequency (default: 92×10^9 Hz, VLA H41 α RRL)
- x = evaluation frequency (default: 345×10^9 Hz, ALMA CO J=3-2 window)
- F_U = parent universal field value (default: -9.999×10^{-4} from Ub_jet)

This modulates the buoyancy contribution across the observational frequency space, distributing the anti-collapse force across the full emission spectrum.

§3 Part I — Eigenvalue Positivity Proof

The UQFF compressed tensor in its diagonal form is:

$$\text{UQFF}_{\text{comp}} = \text{diag}\left(\frac{P_{\text{order}}}{2P_{\text{order}}}, \frac{P_{\text{order}}}{2P_{\text{order}}}, \dots, \frac{P_{\text{order}}}{2P_{\text{order}}}\right)$$

The eigenvalue equation $\det(\text{UQFF}_{\text{comp}} - \lambda I) = 0$ for the diagonal matrix factors as:

$$\left(\frac{P}{2} - \lambda\right)^2 \left(\frac{2P}{3} - \lambda\right) = 0$$

yielding eigenvalues:

$$\lambda_{1,2} = \frac{P_{\text{order}}}{2} \approx 3.333 \times 10^{-6}, \quad \lambda_3 = \frac{2P_{\text{order}}}{3} \approx 6.667 \times 10^{-6}$$

Proof of positivity:

$$P_{\text{order}} = \frac{e^{-E/F_{\text{max}}}}{Z} > 0 \quad \text{since } E \text{ finite, } F_{\text{max}} > 0, \quad Z = 10^5 > 0$$

Therefore $\lambda_{1,2,3} > 0$: **no zero eigenvalue exists** $\rightarrow$ no zero-energy ground state $\rightarrow$ no collapse mode.

This is the UQFF analogue of the Yang-Mills mass gap: the minimum eigenvalue $\lambda_{\min} = P_{\text{order}}/3 > 0$ ensures a non-zero energy gap between the vacuum and the first excited state, preventing runaway collapse dynamics.

§4 Part II — Anti-Collapse Gradient Theorem

Theorem: $F_{U,Bi,i}$ maintains a bounded repulsive gradient in the density-frequency product space, preventing accumulation of matter toward a singularity.

The modulated buoyancy gradient with respect to density:

$$\frac{\partial F_{\{U,Bi,i\}}}{\partial \rho} = g \left(1 - \frac{1}{\rho^2} \right) \cdot \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right) \cdot F_U$$

The Gaussian envelope $\exp(\ldots)$ in $(0,1)$ ensures this gradient is always **bounded** — it cannot diverge. The sign depends on ρ relative to unity in the normalised density frame, but crucially:

- The gradient is **modulated by the Gaussian**, never infinite
- Combined with the positive eigenvalue bound, $F_{\{U,Bi,i\}}$ cannot grow without limit

Conclusion: No density configuration within UQFF allows $\frac{\partial F_{\{U,Bi,i\}}}{\partial \rho} \rightarrow \infty$ — the Gaussian modulation hard-caps the gradient at all scales.

§5 Part III — Bounded Integral Theorem

Theorem: The integral of $F_{\{U,Bi,i\}}$ over all frequencies is finite and bounded.

$$\int_{-\infty}^{\infty} F_{\{U,Bi,i\}} dx = \sqrt{\frac{\pi}{2}} \cdot \sigma \cdot \text{erf}\left(\frac{x-\mu}{\sigma}\right) \cdot F_U$$

The error function $\text{erf}(\cdot)$ in $(-1, 1)$, so:

$$\left| \int F_{\{U,Bi,i\}} dx \right| \leq \sqrt{\frac{\pi}{2}} \cdot \sigma \cdot |F_U| < \infty$$

This proves that the total buoyancy energy in any frequency-resolved observational window is always finite. Unlike Newtonian or Einsteinian frameworks where energy can diverge at point singularities, UQFF guarantees finite energy integrals at all scales.

§6 BH26 Number System: Gaussian Frequency Bins

The Buoyancy Harmonics (BH26) number system manifests through the Gaussian evaluation at the three canonical emission frequencies:

Bin	Frequency	Gaussian Weight	Physical Source
Bin 1	92 GHz	$\mathcal{G}(92 \text{ GHz})$	VLA H41 α /He41 α RRL
Bin 2	225 GHz	$\mathcal{G}(225 \text{ GHz})$	ALMA Band 6 continuum
Bin 3	345 GHz	$\mathcal{G}(345 \text{ GHz})$	ALMA CO J=3-2

Each bin weight is $\mathcal{G}(\nu) = \exp(-(\nu-\mu)^2/(2\sigma^2))$. The ratio between adjacent bins defines the BH26 harmonic ladder — the same structure that produces the 26-layer compressed gravity

framework. With $\sigma = 10^{16}$ Hz (wide-band), all three bins achieve near-unit weight, confirming that the anti-collapse force operates uniformly across the full observational spectrum.

§7 Comparison to Existing Frameworks

Framework	Singularity allowed	Collapse prevention	Energy boundedness
Newtonian gravity	Yes ($r \rightarrow 0$, $F \rightarrow \infty$)	No	No
General Relativity	Yes (Schwarzschild, Kerr)	No	No
UQFF F_U_Bi_i	No ($\lambda > 0$, Gaussian bounded)	Yes	Yes

The UQFF proof does not require a horizon, a cutoff, or regularisation — the positive eigenvalue structure and Gaussian boundedness are inherent to the framework.

§8 Conclusions

The three-part eigenvalue proof establishes that:

1. **All UQFF eigenvalues are positive** — no zero modes $\rightarrow$ no collapse
2. **The anti-collapse gradient is bounded** by the Gaussian envelope $\rightarrow$ no singularity
3. **The frequency integral is finite** $\rightarrow$ no divergent energy accumulation

$F_{U,Bi,i}$ is therefore the formal anti-collapse certificate of the Universal Quantum Field Framework, supporting all system dynamics from proplyd disk formation to galaxy mergers without invoking dark matter, dark energy, or artificial regularisation.
