DPM Extended Periodic Table Proportion System

CP4 Class: #454 DPMExtendedPeriodicTableProportionCalc
Session 200C v5.61 | Source: describe mass without using weight.txt

Abstract

Develops a system of unique DPM proportions ($f_{UA'}$, f_{SCm}) for every atom in the universe, extending the Periodic Table to $Z_{max}=10,000$. $f_{UA'}=(Z_{max}-Z)/Z_{max}$; $f_{SCm}=Z/Z_{max}$. All atoms start radioactive with decay rate $\lambda=k_{\lambda}f_{SCm}$ and stabilize over time. Reactivity gradient $R_{EB}=k_R Z$. SM_magnetic/non-magnetic alternation.

Key Equations

$f_{UA'} = (Z_{max} - Z) / Z_{max}$
 $f_{SCm} = Z / Z_{max}$
 $f_{UA'} + f_{SCm} = 1$ (DPM fully defines nucleus)
 $R_{EB} = k_R * Z$ (reactivity gradient)
 $\lambda = k_{\lambda} * f_{SCm}$ (radioactive decay rate)
 L_{quant} proportional to $f_{UA'} * f_{SCm} * R_{EB}$
