Universal Speed Range $c^{26}i^{-26}$ and Cosmic Photon Deceleration

CP4 Class: #455 UniversalSpeedRangeCosmicPhotonDecelerationCalc
Session 200C v5.61 | Source: describe mass without using weight.txt

Abstract

Defines the universal speed range as $c^{26}i^{-26}$, where $c=2.998e8$ m/s. $E=c^2$ is redefined as the speed of visible light in the cosmic vacuum (UA). Cosmic photons originate as heavy metal ions emitted from nuclear shells, decelerating from $c^{26}i^{-26}$ to c^2 through 26 quantum layers.

Key Equations

$v_{\text{range}} = c^{26} * i^{-26}$ (universal speed range)
 $E = c^2 = (2.998e8)^2 \sim 8.988e16 \text{ m}^2/\text{s}^2$ (light speed in UA)
 $v_{\text{photon}}(\text{layer}) = c^{26-\text{layer}+1}$
Cosmic photon: heavy metal ion $\rightarrow$ slows $c^{26}i^{-26} \rightarrow c^2$
