Three-Assumption UQFF Cosmogenesis Master Integration

CP4 Class: #461 ThreeAssumptionUQFFCosmogenesisCalc

Session 200C v5.61 | Source: describe mass without using weight.txt

Abstract

Master integration of the complete UQFF cosmogenesis model: (1) Three reactive quantum fundamentals (electrostatic barrier, UA, SCm) form proto-nuclear shells via DPM. (2) Proto-shells evolve through EM bang and 2 expansion/contraction cycles to produce proto-atoms (proto-H=proto-Fe, proto-He=proto-Si). (3) Four U_g forces govern all interactions: U_{g1}=DPM, U_{g2}=shells, U_{g3}=U_i+U_m, U_{g4i}=control. 26 quantum atomic states before mass; quantum-to-mass gradient at 7-10 U_{mag} degrees.

Key Equations

```
=== Assumption 1 ===
f_UA' = (Z_max-Z)/Z_max; f_SCm = Z/Z_max; R_EB = Z
=== Assumption 2 (ACP) ===
U_i = k*(rho_SCm - rho_UA/10)*omega*cos(pi*t)
Psi_proto = Sum_{i=1}^{26} U_m,i
C_vac = rho_vac*r      (capacitance = vacuum energy density)
=== Assumption 3 (Forces) ===
F_Ug1 = DPM summation with geometry
E_Ug2 = c*nu*hbar*f_SCm
F_Ug3 = (U_i + U_m)/r^2
E_Ug4i = f_SCm*nu*rho_SCm
```
