Classification: FIRST unified multi-system F_env modular architecture in UQFF; FIRST std::map dynamic variable storage for astrophysical UQFF systems

Author: Daniel T. Murphy

CP4 Class: MultiSystemUQFFCoreCalculator (#2, PAPER_448)

Abstract

The Multi-System UQFF Core Compression Framework establishes the architectural template for UQFF Compression Cycle 2, defining the shared methodology by which an arbitrary number of astrophysical systems can be simultaneously calculated under a single compressed gravitational equation. The unified architecture uses modular environmental factor (F_env) summation with Hubble evolution $H(t, z)$, standard map-based dynamic variable storage, and consistent UQFF/MUGE term parameterisation across all Cycle 2 systems. The seven canonical systems (MagnetarSGR1745, SagittariusA, TapestryStarbirth, Westerlund2, PillarsCreation, RingsRelativity, UniverseGuide) define the baseline registry from which the 19- and 29-system expansions are derived.

2. Core Architecture — PAPER_448

2.1 Compression Cycle 2 Philosophy

In UQFF Compression Cycle 1 (Sessions 1–114), each astrophysical system maintained a dedicated class with hardcoded parameters. Compression Cycle 2 introduces a **generalised modular registry** in which:

1. System parameters are stored in `std::map<std::string, double>` containers
2. Environmental factors F_env are computed as a unified sum across all system-specific terms
3. A single compressed `g_UQFF(t)` equation applies to any registered system
4. Dynamic parameter updates propagate automatically through the registry

2.2 Unified Gravitational Equation (Core)

$$g_{\text{UQFF}}(r, t) = \frac{GM(t)}{r^2} (1 + H_z t) (1 - B/B_{\text{crit}}) + \sum_i U_{gi} + \frac{\Lambda c^2}{3} + g_{\text{quantum}} + g_{\text{fluid}} + F_{\text{env}}(t)$$

Where the total environmental modifier:

$$F_{\text{env}}(t) = \sum_{j=1}^{N_{\text{sys}}} F_{\text{env}}^{(j)}(t, \{p_j\})$$

With $\{p_j\}$ = system-specific parameter map for system j .

2.3 Hubble Evolution Module

$$H(t, z) = H_0 \sqrt{\Omega_m (1+z)^3 + \Omega_\Lambda}$$

Evaluated at z for each system: - Local ($z=0$): $H = 70$ km/s/Mpc - Intermediate ($z=0.5$): $H = 85$ km/s/Mpc

- Cosmological ($z=1100$, CMB): $H = 70 \times \sqrt{(0.3 \times 1100^3 + 0.7)}$ km/s/Mpc

$$H_z = H(z)/H_0 \text{ [dimensionless Hubble factor]}$$

2.4 Dynamic Variable Storage (FIRST in UQFF)

The C++ implementation introduces `std::map<std::string, double>` as the canonical storage for per-system variables:

```
params["M"]      = system_mass      [kg]
params["r"]      = radius            [m]
params["z"]      = redshift          [dimensionless]
params["B"]      = magnetic_field    [T]
params["v_exp"]  = expansion_vel     [m/s]
params["rho"]    = fluid_density     [kg/m³]
params["F_env"]  = env_modifier      [m/s²]
params["SC_m"]   = superconductive   [dimensionless]
```

This is the **first use of runtime-keyed variable maps** for per-system UQFF gravity in the code-base — replacing class-member variables with $O(\log n)$ lookup tables allowing unlimited parameter extension without recompilation.

2.5 Canonical 7-System Registry

System	type_key	key parameters
MagnetarSGR1745	MAGNETAR_SGR1745	$M=2.8 \text{ M}$, $r=1\text{e}4 \text{ m}$, $B=1\text{e}11 \text{ T}$
SagittariusA	SAGITTARIUS_A	$M=4.1\text{e}6 \text{ M}$, $r=6\text{e}9 \text{ m}$, $B=1\text{e}-3 \text{ T}$
TapestryStarbirth	TAPESTRY_STARBIRTH	$M=500 \text{ M}$, $r=1\text{e}16 \text{ m}$, $z=0.001$
Westerlund2	WESTERLUND2	$M=1\text{e}4 \text{ M}$, $r=6\text{e}16 \text{ m}$, $z=0.005$
PillarsCreation	PILLARS_CREATION	$M=200 \text{ M}$, $r=6\text{e}16 \text{ m}$, $z=0.002$
RingsRelativity	RINGS_RELATIVITY	$M=1\text{e}39 \text{ kg}$, $r=1\text{e}20 \text{ m}$, $z=0.3$
UniverseGuide	UNIVERSE_GUIDE	$M=1\text{e}53 \text{ kg}$, $r=4.4\text{e}26 \text{ m}$, $z=1100$

These 7 are the Compression Cycle 2 **root systems** — all subsequent 19- and 29-system registries add to this base.

3. Ug Component Summary

3.1 Ug1 — Magnetic Dipole Term

$$U_{g1} = -\frac{\mu_0 m_1 m_2}{4\pi r^3} \left(1 - \frac{r_s}{r}\right)$$

3.2 Ug2 — Charge Reactivity Term

$$U_{g2} = k_e \frac{q_1 q_2}{r} \left(1 + \frac{\kappa t}{\tau_q} \right)$$

3.3 Ug3 — String Rotation Term (UQFF-specific)

$$U_{g3} = \frac{GM_{\text{ext}}}{r_{\text{ext}}^2} \left(1 + \frac{v_s}{c} \cos \theta \right)$$

Compressed form (Cycle 2):

$$U'_{g3} = \frac{GM_{\text{ext}}}{r_{\text{ext}}^2}$$

3.4 Ug4 — Vacuum Concentration Term

$$U_{g4} = U_A \rho_{\text{vac}} (1 + [\text{UA}] \cdot [\text{SCm}])$$

4. Quantum and Fluid UQFF Terms

4.1 Quantum Gravity Coupling

$$g_{\text{quantum}} = \frac{\hbar c}{l_p^2} \frac{t}{t_p} \cdot \frac{1}{Mc^2}$$

Where $l_p = \sqrt{\hbar G/c^3} = 1.616 \times 10^{-35}$ m (Planck length), $t_p = l_p/c$.

4.2 Fluid Navier-Stokes Coupling

$$g_{\text{fluid}} = \nu_{\text{fluid}} \nabla^2 v + (\mathbf{v} \cdot \nabla) \mathbf{v}$$

Simplified for radial symmetry:

$$g_{\text{fluid}} \approx \rho_{\text{fluid}} v_{\text{exp}}^2 / r$$

5. Ψ_{total} Integration

The full quantum-gravitational wave function total combines UQFF modes:

$$\psi_{\text{total}} = \int_0^\infty A(k) e^{i(kr - \omega t)} dk + \frac{[SSq]^{n_{26}}}{[SSq]^{n_{26}-1}}$$

The discrete multi-system version sums over all N registered systems:

$$\psi_{\text{total}}^{(N)} = \sum_{j=1}^N g_{\text{UQFF}}^{(j)}(r, t) \cdot w_j$$

Where w_j = system weight (default: equal weights = $1/N$).

6. Standard Model Comparison

Feature	SM	CC2 (UQFF)
Per-system gravity	Individual Poisson eq.	Unified compressed registry
Environmental coupling	External perturbation	Built-in <code>F_env</code> term
Dynamic parameter storage	Compile-time	Runtime <code>std::map</code>
Multi-system simultaneity	Separate solvers	Single <code>g_UQFF</code> call for N systems

7. Testable Predictions

1. **Runtime extensibility:** Adding a new astrophysical system to the Cycle 2 registry should require zero recompilation — only map insertion. Testable by adding any new entry and verifying output.
 2. **`F_env` additivity:** For two weakly-interacting systems (e.g., Tapestry + Pillars at large separation), `F_env_total` = `F_env_1` + `F_env_2` within 0.1%.
 3. **Hubble evolution consistency:** $H(z=0.5)$ from the modular $H(t,z)$ function should reproduce $H \sqrt{(0.3 \times 1.5^3 + 0.7)} = H \times 0.894 = 62.6 \text{ km/s/Mpc}$ ($\pm 1\%$).
