Abstract

SGR 1745-2900 is the closest known magnetar to a supermassive black hole, located at a projected separation of 0.09–0.3 pc from Sagittarius A* and a deprojected estimate of ~ 0.92 pc. This paper documents three MUGE terms absent from the Session 53 implementation (MagnetarSGR1745DynamicModulationCalculator): (1) SMBH tidal coupling acceleration $a_{\text{BH}} = G M_{\text{SgrA*}}/r_{\text{BH}}^2$, (2) static (non-decaying) magnetic stored energy $a_{\text{mag}} = B^2 V/(2\mu_0 M_r)$ with $B = 2 \times 10^{10}$ T, and (3) use of the ATNF-catalogued pulse period $P = 3.76$ s (replacing an inferred value). The superconductive suppression factor is also refined to $f_{\text{sc}} = 1 - B/B_{\text{crit}}$.

1. Physical System

SGR 1745-2900's proximity to Sgr A* makes it unique in the magnetar population:

Parameter	Value
Position	~ 0.09 pc projected, ~ 0.92 pc deprojected from Sgr A*
M	$1.4 M_{\odot}$ (NS)
r	20 km (NS radius)
B	2×10^{10} T (static; not decaying)
B_{crit}	4.4×10^{13} T
P_{init}	3.76 s (ATNF Pulsar Catalogue)
τ_{Ω}	8000 yr
L_0	5×10^{28} W

Parameter	Value
τ_d	1000 s
M_{SgrA^*}	$4 \times 10^6 M_\odot$
r_{BH}	$0.92 \text{ pc} = 2.83 \times 10^{16} \text{ m}$

2. New Terms vs Session 53

Comparison Table

Term	Session 53	Session 58 Enhancement
BH proximity	Absent	$a_{\text{BH}} = \frac{GM_{\text{SgrA}^*}}{r_{\text{BH}}^2}$
B field	Decaying $B(t) = B_0 e^{-t/\tau_B}$	Static $B = 2 \times 10^{10} \text{ T}$
Superconductivity	Generic f_{TRZ}	$f_{\text{sc}} = 1 - B/B_{\text{crit}}$
Pulse period	Inferred from P_{dot}	$P = 3.76 \text{ s (ATNF)}$
Magnetic energy	Absent	$a_{\text{mag}} = B^2 V / (2\mu_0 M_r)$
Burst decay	Absent	$a_{\text{decay}} = L_0 \tau_d (1 - e^{-t/\tau_d}) / (M_r)$

3. SMBH Tidal Coupling (Novel in SGR 1745 context)

$$a_{\text{BH}} = \frac{GM_{\text{SgrA}^*}}{r_{\text{BH}}^2} = \frac{6.674 \times 10^{-11} \times 4 \times 10^6}{(2.83 \times 10^{16})^2} \times 1.989 \times 10^{30} \approx 6.63 \times 10^{-7} \text{ m/s}^2$$

$$a_{\text{BH}} = \frac{5.309 \times 10^{26}}{8.01 \times 10^{32}} \approx 6.63 \times 10^{-7} \text{ m/s}^2$$

This tidal coupling from the $4 \times 10^6 M_\odot$ SMBH is **dominant over the magnetar's self-gravity** at 0.92 pc, where the self-gravity $GM_{\text{NS}}/r_{\text{NS}}^2 \approx 2 \times 10^{12} \text{ m/s}^2$ only at the neutron star surface.

4. Static Magnetic Energy (Novel vs Session 53)

$$a_{\text{mag}} = \frac{B^2}{2\mu_0} \cdot \frac{V_{\text{NS}}}{M_r} = \frac{(2 \times 10^{10})^2}{2 \times 4\pi \times 10^{-7}} \cdot \frac{(4\pi/3)(20000)^3}{2.785 \times 10^{30} \times 20000}$$

Session 53 used a decaying $B(t)$; this implementation uses a **static** B field, reflecting evidence that SGR 1745-2900's field has remained stable since its 2013 activation.

5. Superconductive Factor

$$f_{\text{sc}} = 1 - \frac{B}{B_{\text{crit}}} = 1 - \frac{2 \times 10^{10}}{4.4 \times 10^{13}} = 1 - 4.55 \times 10^{-4} \approx 0.99955$$

Applied to the base gravity: $a_{\text{base}} = \frac{GM}{r^2} \cdot (1 + H_0 t) \cdot f_{\text{sc}}$ — a ~0.05% suppression from near-critical field.

6. ATNF Pulse Period

The pulse period $P = 3.76$ s is directly from the ATNF Pulsar Catalogue (2024), more precise than the $P \approx 3.8$ s sometimes quoted. This affects the spin-down back-reaction:

$$\frac{d\Omega}{dt} = -\frac{2\pi}{P \tau_\Omega} e^{-t/\tau_\Omega}$$

7. Calculator Class

```
class SGR1745BHProximityMagEnergyCalculator(_CP3Calculator):  
    """PAPER_233: SGR 1745-2900 enhanced – BH tidal a_BH, static mag energy, ATNF P=3.76s"""  
    # Session 58 – grok_share_8d951e12.txt Doc 14 enhanced
```

Located in CondensedPhysics3.py (Session 58).

8. Conclusion

The enhanced SGR 1745-2900 MUGE adds three physically motivated terms absent from Session 53: SMBH tidal coupling (dominant at 0.92 pc), static magnetic energy density, and ATNF-calibrated pulse period. The result is the most complete MUGE treatment of any Galactic Centre magnetar in the UQFF library.
