PAPER289: Cooper-DPM Dual-Frequency SC Synthesis — $\times f_{\text{super}} \times f_{\text{DPM}}$ Triple-Mode Quantum Product (Asc = 6.994×10^{21})

Series: UQFF Resonance-Superconductive Framework **Module:** RESONANCE_SUPERCONDUCTIVE_UQFF_MODULE.cpp (23rd C++ module — FIRST universal RSC module) **Session:** 81 | **Date:** March 17, 2026 **Author:** Daniel T. Murphy **WOLFRAM_TERM:** `RSC\_UQFF:a\_sc\_freq=hbar\*f\_super\*f\_DPM\*a\_DPM/(E\_vac\*c); A\_sc=6.994e21; SCm=1-B/B\_crit->0 at B->B\_crit`

Abstract

This paper presents UQFF derivations and numerical results for: PAPER289: *Cooper-DPM Dual-Frequency SC Synthesis* — $\times f_{\text{super}} \times f_{\text{DPM}}$ Triple-Mode Quantum Product (Asc = 6.994×10^{21}). Calibration constants: $\kappa = 0.0005/\text{day}$, $[\text{SSq}] = 0.57$. Results validated against observational data and prior UQFF whitepaper series.

1. Discovery Statement

The UQFF SC-frequency term couples **Cooper pair quantum energy** ($\times f_{\text{super}}$) to DPM resonance through the plasmonic vacuum, creating a **triple-mode quantum product**:

$$a_{\text{sc_freq}} = \frac{\hbar \cdot f_{\text{super}} \cdot f_{\text{DPM}} \cdot a_{\text{DPM}}}{E_{\text{vac}} \cdot c}$$

with SC amplification factor:

$$A_{\text{sc}} = \frac{\hbar \cdot f_{\text{super}} \cdot f_{\text{DPM}}}{E_{\text{vac}} \cdot c} = 6.994 \times 10^{21}$$

The **full UQFF Resonance-SC** corrects all resonance modes by the Meissner factor:

$$g_{\text{res_sc}}(t, B) = a_{\text{res_total}} \cdot \underbrace{\left(1 - \frac{B}{B_{\text{crit}}}\right)}_{\text{SCm}} \cdot (1 + f_{\text{TRZ}})$$

At $B \rightarrow B_{\text{crit}}$: $\text{SCm} \rightarrow 0$ — the **UQFF Resonance-Channel Meissner Gravity Quench**.

This is the **first UQFF module** applying the Meissner quench to a *pure resonance channel* (previous PAPER_266 HUDF applied it to the full gravity sum of a galactic module).

2. Physical Equations

2.1 Cooper Pair Quantum Energy

$$E_{\text{Cooper}} = \hbar \cdot f_{\text{super}} = 1.0546 \times 10^{-34} \times 1.411 \times 10^{16}$$

$$\boxed{E_{\text{Cooper}} = 1.488 \times 10^{-18} \text{ J} = 9.29 \text{ eV}}$$

This energy sits at the extreme-UV / near-X-ray boundary, corresponding to the Cooper pair pairing energy at the magnetar critical field $B_{\text{crit}} = 10^{11}$ T frequency scale.

2.2 SC Amplification Factor

$$A_{\text{sc}} = \frac{E_{\text{Cooper}} \cdot f_{\text{DPM}}}{E_{\text{vac}} \cdot c} = \frac{1.488 \times 10^{-18} \times 10^{12}}{7.09 \times 10^{-36} \times 3 \times 10^8}$$

$$\boxed{A_{\text{sc}} = \frac{1.488 \times 10^{-6}}{2.127 \times 10^{-28}} = 6.994 \times 10^{21}}$$

The three coupled modes are:

Cooper pair at $f_{\text{super}} = 1.411 \times 10^1$ Hz (UV-energy superconductor frequency)

DPM resonance at $f_{\text{DPM}} = 1 \times 10^{12}$ Hz (THz plasma dipole mode)

Plasmonic vacuum $E_{\text{vac}} = 7.09 \times 10^{-3} \text{ J/m}^3$ (vacuum energy normalization)

2.3 SC Frequency Acceleration

$$a_{\text{sc_freq}} = A_{\text{sc}} \times a_{\text{DPM}} = 6.994 \times 10^{21} \times 3.545 \times 10^{-18}$$

$$a_{\text{sc_freq}} \approx 2.479 \times 10^4 \text{ m/s}^2$$

This large value is physically modulated by the Meissner correction at high B fields.

3. Meissner Gravity Quench

3.1 SC Correction

$$\text{SCm} = 1 - \frac{B}{B_{\text{crit}}}$$

B (T)	B/B _{crit}	SCm	gressc / a _{res}
1×10 ⁻¹ (ISM)	1×10 ⁻¹	≈1.0	1.10
1×10 ¹ (neutron star crust)	1×10 ¹	0.9999	1.10
5×10 ¹⁰ (near magnetar)	0.5	0.5	0.55
9×10 ¹⁰	0.9	0.1	0.11
1×10 ¹¹ = B _{crit}	1.0	0.0	0 (quench)

3.2 Time-Reversal Amplification

At all fields, the $(1 + f_{\text{TRZ}}) = 1.1$ factor ($f_{\text{TRZ}} = 0.1$) adds a 10% time-reversal enhancement. At $B = 0$: $\text{gressc} = 1.1 \times \text{aretotal}$ (maximum resonance contribution).

3.3 Resonance-Channel Meissner Quench

The UQFF Resonance-Channel Meissner Quench differs from PAPER_266 (HUDE galactic Meissner) in:

Feature	PAPER_266 (HUDF)	PAPER_289 (RSC)
Applied to	Full galaxy g_total sum	Pure resonance a_res sum
System	Cosmic deep field z=3.5	Universal resonance module
B_crit	10 ¹¹ T	10 ¹¹ T
SCm form	1-B/B_crit	1-B/B_crit
Novel aspect	First galactic SC quench	First resonance-specific SC quench

The RSC module demonstrates that the Meissner quench acts *selectively* on resonance channels — a clear prediction: in magnetar environments where $B \approx B_{\text{crit}}$, the resonance-SC gravity contribution is completely suppressed while non-resonant gravitational terms (Newtonian, Λ) remain unaffected.

4. Triple-Mode Coupling Interpretation

The product $\hbar \times f_{\text{super}} \times f_{\text{DPM}}$ represents **sum-frequency generation in the quantum vacuum**:

- $\hbar \times f_{\text{super}}$ = Cooper pair energy quantum (UV regime, 9.29 eV)
- $\hbar \times f_{\text{DPM}}$ = DPM energy quantum = $1.0546 \times 10^{-3} \hbar \times 10^{12} = 1.055 \times 10^{-22} \text{ J} = 6.6 \times 10^{-7} \hbar \text{ eV}$ (far-IR)
- Product: $\hbar^2 \times f_{\text{super}} \times f_{\text{DPM}}$ = two-photon energy product (UV $\times$ THz)

Normalizing by $E_{\text{vac}} \times c$ gives the gravity acceleration coupling rate — the UQFF vacuum acts as the **phase-matching medium** for this UV-THz parametric interaction.

This is analogous to parametric downconversion in nonlinear optics, but in the UQFF gravitational vacuum: a UV Cooper-pair photon and a THz DPM phonon are coupled through the plasmotic vacuum to produce a gravitational acceleration signature.

5. UQFF Parameters

Quantity	Symbol	Value
Cooper pair energy	$E_{\text{Cooper}} = \hbar \times f_{\text{super}}$	$1.488 \times 10^{-18} \hbar \text{ J}$ (9.29 eV)
SC amplification	A_{sc}	6.994×10^{21}
SC frequency term	a_{scfreq}	$2.479 \times 10^{-18} \hbar \text{ m/s}^2$
DPM seed	a_{DPM}	$3.545 \times 10^{-1} \hbar \text{ m/s}^2$
Meissner quench field	B_{crit}	10^{11} T
TRZ enhancement	$(1+f_{\text{TRZ}})$	1.1
Full factor ($B \approx 0$)	$A_{\text{sc}} \times (1+f_{\text{TRZ}})$	7.693×10^{21}
