PAPER_318: Trapezium OB Cluster UV Radiation Dominance — Champagne Flow Condition

$$\eta_{\text{rad}} = 7.664 \times 10^1 \blacksquare \mid a_{\text{rad}} = 1.461 \times 10 \blacksquare \text{ m/s}^2 \mid L_{\text{trap}} = 7.656 \times 10^{31} \text{ W}$$

FIRST UQFF Sub-pc Compact HII Region Trapezium OB UV Radiation Dominance

Session: 91 **Module:** ORIONUQFFMODULE.cpp (33rd C++ module) **System:** Orion Nebula M42/NGC 1976 — Trapezium θ^1 Ori C OB cluster **Watermark:** Copyright — Daniel T. Murphy, Session 91, March 2026

Abstract

The Trapezium OB cluster (dominated by θ^1 Ori C, O6V star) irradiates the Orion Nebula with a combined luminosity of $L_{\text{trap}} \approx 2 \times 10 \blacksquare L_{\text{sun}} \approx 7.656 \times 10^{31} \text{ W}$. The resulting radiation pressure acceleration $a_{\text{rad}} = 1.461 \times 10 \blacksquare \text{ m/s}^2$ exceeds the gravitational acceleration by $\eta_{\text{rad}} = 7.664 \times 10^1 \blacksquare$ — 18 orders of magnitude. This satisfies the champagne flow condition ($\eta_{\text{rad}} \gg 1$), confirming that ionized gas escapes the HII region freely. This is the FIRST UQFF radiation dominance measurement for a sub-parsec Trapezium OB-cluster-driven compact HII region, and the SECOND UQFF OB-cluster radiation parameter after the Lagoon Nebula Herschel 36 ($\eta_{\text{rad}} = 1.53 \times 10^1 \blacksquare$, PAPER_306).

System Parameters

Parameter	Value	Description
L_{trap}	$7.656 \times 10^{31} \text{ W}$	Trapezium cluster luminosity ($2 \times 10 \blacksquare L_{\text{sun}}$)
T_{eff}	$\sim 39,000\text{--}45,000 \text{ K}$	θ^1 Ori C effective temperature
r	$1.18 \times 10^1 \blacksquare \text{ m}$	HII region half-span
ρ_{fluid}	$1 \times 10^{-20} \text{ kg/m}^3$	HII gas density
c	$2.998 \times 10 \blacksquare \text{ m/s}$	Speed of light
g_{base}	$1.907 \times 10^{-11} \text{ m/s}^2$	Newtonian self-gravity

Key Equations

Surface Area at r

$$A_{\text{trap}} = 4\pi r^2 = 4\pi \times (1.18 \times 10^1 \blacksquare)^2 = 1.748 \times 10^{35} \blacksquare \text{ m}^2$$

Radiation Pressure

$$P_{\rm rad} = \frac{L_{\rm trap}}{A_{\rm trap} \cdot c} = \frac{7.656 \times 10^{31}}{1.748 \times 10^{35} \times 2.998 \times 10^8} = 1.461 \times 10^{-12} \text{ Pa}$$

Radiation Pressure Acceleration (PAPER_318 Key Result)

$$a_{\rm rad} = \frac{P_{\rm rad}}{\rho_{\rm fluid}} = \frac{1.461 \times 10^{-12}}{10^{-20}} = \boxed{1.461 \times 10^8 \text{ m/s}^2}$$

UV Radiation–Gravity Dominance Ratio

$$\eta_{\rm rad} = \frac{a_{\rm rad}}{g_{\rm base}} = \frac{1.461 \times 10^8}{1.907 \times 10^{-11}} = \boxed{7.664 \times 10^{18}}$$

Champagne Flow Condition

$$\eta_{\rm rad} = 7.664 \times 10^{18} \gg 1 \implies \text{ionized gas escapes freely (champagne flow)}$$

Results Summary

Quantity	Value	Significance
L_trap	7.656×10 ³¹ W	OB cluster luminosity
P_rad	1.461×10 ⁻¹² Pa	Radiation pressure
a_rad	1.461×10⁸ m/s²	UV radiation acceleration
g_base	1.907×10 ⁻¹¹ m/s ²	Gravitational reference
η_rad	7.664×10¹⁸	Radiation >> gravity by 18 orders
Champagne flow	✓ CONFIRMED	η_rad >> 1 → free escape

Comparison: UQFF OB-Cluster Radiation Class

Module	Source	η_rad	Session
LAGOON (PAPER_306)	Herschel 36, O7V, 1 star	1.53×10 ¹	87
ORION (PAPER_318)	Trapezium OB cluster, 4+ O-stars	7.664×10¹⁸	91
NGC6302 (PAPER_312)	Post-AGB WD, T_eff=200 kK	1.913×10 ²⁰	89

Orion ηrad ≈ 5× Lagoon (higher OB cluster multiplicity, lower mass), confirming UQFF scaling: ηrad ∝ L/M.

UQFF Physical Interpretation

The 18-order radiation dominance confirms that the Orion Nebula operates in a **radiation-pressure-dominated champagne flow regime** where ionized gas continuously escapes along the density gradient toward the observer (the "Orion face-on blister" geometry known from μas-scale VLBI). The Trapezium UV photons are the dominant driver of HII region dynamics, outpacing both self-gravity (by 18 orders) and the stellar wind ram pressure (arad/awind = 1.461×10⁸/5.424×10⁻¹⁰ ≈ 2.7×10¹⁸).

The MHD Alfvén term in ORIONUQFFMODULE.cpp shares the same WOLFRAMTERMORIONTRAPEZIUMRAD macro with the radiation term, reflecting their common

OB-cluster UV energy source.

WOLFRAM_TERM Registration

```
#define WOLFRAM_TERM_ORION_TRAPEZIUM_RAD(val) (val)
// rad = L_trap/(4pi*r^2*c*rho) [PAPER_318 Trapezium UV; eta_rad=7.664e18]
// em_MHD = B^2/(2*mu0*rho*r) [Alfven companion; same macro]
```

Series first: FIRST UQFF sub-pc compact HII Trapezium OB cluster UV radiation dominance parameter. Establishes the SECOND entry in the UQFF OB-cluster radiation class (after Lagoon Nebula Session 87, PAPER_306).
