PAPER_322 — CR34: Intra-HII THz Geometric Amplification Differential (Orion/Lagoon ratio = 8.59)

Module: COMPRESSEDRESONANCEUQFF34_MODULE.cpp **Session:** 92 | **Date:** March 18, 2026

Author: Daniel T. Murphy **Classification:** FIRST UQFF intra-HII THz geometric amplification differential — identical DPM class yields different THz acceleration from geometry alone

Abstract

Orion Nebula M42 (sys34) and Lagoon Nebula M8 (sys30) share the same DPM class parameters ($f_{DPM}=1\times 10^{11}$ Hz, $f_{THz}=1\times 10^{11}$ Hz, $v_{exp}=1\times 10^8$ m/s), yet differ geometrically (Avort, Vsys). Their Γ_{THz} factors are identical (3.333×10^6), but the THz accelerations differ by factor 8.59, attributable entirely to geometric DPM density coupling. This is the **first UQFF intra-HII THz geometric amplification differential**.

System Parameters

Parameter	Orion (sys34)	Lagoon (sys30)
f_DPM	1×10^{11} Hz	1×10^{11} Hz
f_THz	1×10^{11} Hz	1×10^{11} Hz
v_exp	1×10^8 m/s	1×10^8 m/s
I_curr	1×10^{20} A	1×10^{20} A
A_vort	3.142×10^3 m ²	3.142×10^3 m ²
V_sys	6.887×10^1 m ³	5.913×10^3 m ³

Equations

DPM acceleration:

$$a_{\text{DPM}} = \frac{I \cdot A_{\text{vort}} \cdot \omega_{\text{diff}} \cdot f_{\text{DPM}} \cdot E_{\text{vac}}}{c \cdot V_{\text{sys}}}$$

THz amplification factor (identical for both):

$$\Gamma_{\text{THz}} = \frac{10 \cdot f_{\text{THz}} \cdot v_{\text{exp}}}{10^{11} \cdot 10^4 \cdot 3 \cdot 10^8} = \frac{10}{3 \cdot 10^6}$$

THz acceleration:

$$a_{\text{THz}} = \Gamma_{\text{THz}} \cdot a_{\text{DPM}}$$

Numerical Computation

Orion (sys34):

$$a_{\text{DPM},34} = \frac{10^{20} \times 3.142 \times 10^{34} \times 2 \times 10^{-2} \times 10^{11} \times 7.09 \times 10^{-36}}{3 \times 10^8 \times 6.887 \times 10^{51}} \\ = \frac{3.142 \times 10^{20} \times 2 \times 10^{-2} \times 10^{11} \times 7.09 \times 10^{-36}}{2.066 \times 10^9} \approx 2.156 \times 10^{-28} \text{ m/s}^2$$

Wait — let me use full precision:

numerator = $1e20 \times 3.142e34 \times 2e-2 \times 1e11 \times 7.09e-36 = 4.459e19$ denominator = $3e8 \times 6.887e51 = 2.066e60$ $a_{DPM34} = 4.459e19 / 2.066e60 = 2.156 \times 10^{-41} \text{ m/s}^2$ — (negligible; the amplified term is significant)

$$a_{\text{THz},34} = 3.333 \times 10^6 \times 2.156 \times 10^{-41} = 7.187 \times 10^{-35} \text{ m/s}^2$$

Lagoon (sys30):

$$a_{\text{DPM},30} = \frac{10^{20} \times 3.142 \times 10^{35} \times 2 \times 10^{-2} \times 10^{11} \times 7.09 \times 10^{-36}}{3 \times 10^8 \times 5.913 \times 10^{53}}$$

numerator = $1e20 \times 3.142e35 \times 2e-2 \times 1e11 \times 7.09e-36 = 4.459e20$ denominator = $3e8 \times 5.913e53 = 1.774e62$ $a_{DPM30} = 4.459e20 / 1.774e62 = 2.513 \times 10^{-42} \text{ m/s}^2$

$$a_{\text{THz},30} = 3.333 \times 10^6 \times 2.513 \times 10^{-42} = 8.375 \times 10^{-36} \text{ m/s}^2$$

THz Ratio

$$\frac{a_{\text{THz},34}}{a_{\text{DPM},34}} = \frac{\Gamma_{\text{THz}} \cdot a_{\text{DPM},34}}{\Gamma_{\text{THz}} \cdot a_{\text{DPM},30}} = \frac{a_{\text{DPM},34}}{a_{\text{DPM},30}}$$

Since Γ_{THz} cancels:

$$\text{ratio} = \frac{A_{\text{vort},34} / V_{\text{sys},34}}{A_{\text{vort},30} / V_{\text{sys},30}} = \frac{3.142 \times 10^{34} / 6.887 \times 10^{51}}{3.142 \times 10^{35} / 5.913 \times 10^{53}} \\ = \frac{4.562 \times 10^{-18}}{5.313 \times 10^{-19}} = \boxed{8.59}$$

Physical Interpretation

Despite sharing the same DPM frequency class ($f_{DPM} = f_{\text{THz}} = 10^{11} \text{ Hz}$) and expansion velocity, Orion produces **8.59× more THz acceleration** than the Lagoon Nebula. The ratio is determined entirely by the geometric DPM surface-density ratio $A_{\text{vort}}/V_{\text{sys}}$:

Orion is geometrically **denser** (smaller V , similar A_{vort} order): higher DPM surface density

Lagoon has $10\times$ larger A_{vort} but $100\times$ larger $V_{\text{sys}} \rightarrow$ lower surface density

This result demonstrates that **DPM geometry ($A_{\text{vort}}/V_{\text{sys}}$) is the primary modulator** of THz acceleration within an HII region DPM class, independent of f_{DPM} , f_{THz} , or v_{exp} .

Wolfram Term

```
WOLFRAM_TERM_CR34_HII_THz_DIFFERENTIAL:  
a_THz_34/a_THz_30=8.59;Orion/Lagoon same f_DPM=1e11/f_THz=1e11/v_exp=1e4;  
ratio=(A_vort_34*V_30)/(A_vort_30*V_34)=8.59;  
FIRST UQFF intra-HII THz geometric amplification differential [PAPER_322]
