PAPER_342 ■ Magnetar 7-Component DPM-THz Frequency Form: S26 Spin-Down Plus THz Modes

Whitepaper Series: Star-Magic UQFF Phase 2 **Session:** 96 **Source:** gokshare31b5c807a4.txt (Supplemental Gap Analysis Block) **Classification:** FIRST magnetar S26 7-component frequency decomposition **Author:** Daniel T. Murphy

Abstract

The magnetar gravity tensor $g(r,t)$ is decomposed into 7 frequency channels within the S26 double-plasma mirror (DPM) THz formalism. The dominant 26-layer compressive gravity includes five resonance modes (SuperFreq, QuantumFreq, AetherFreq, FluidFreq, ExpFreq) plus THz phonon activation and an spin-down term. For SGR J1745-2900 class magnetars with $P = 3.76$ s, $B = 2 \times 10^{11}$ T, the magnetic energy reservoir is $M_{\text{mag}} = 2.01 \times 10^{37}$ J.

2. Core Physics

2.1 7-Component S26 Gravity Form

$$g(r,t) = \sum_{i=1}^{26} \left[a_i^{\text{DPM}} + a_i^{\text{THz}} + a_i^{\text{SF}} + a_i^{\text{QF}} + a_i^{\text{AF}} + a_i^{\text{FF}} + a_i^{\text{EF}} \right]$$

Components:

DPM baseline: $a_i^{\text{DPM}} = G M_i / r_i^2 \cdot [UA]_i$

THz phonon: $a_i^{\text{THz}} = a_0^{\text{THz}} \cdot \cos(2\pi f_{\text{THz}} t) \cdot Q_i$

SuperFreq (SGR 1745): $a_i^{\text{SF}} = \alpha_{\text{SF}} \cdot \omega_{\text{SF}}^2 \cdot r \cdot [SCm]_i$

QuantumFreq: $a_i^{\text{QF}} = \hbar \omega_{\text{QF}} / (m r^2) \cdot f_i$

AetherFreq: $a_i^{\text{AF}} = \rho_{\text{UA}} \cdot c_s^2 / r \cdot \sin(\omega_{\text{AF}} t)$

FluidFreq (Navier-Stokes): $a_i^{\text{FF}} = \eta \nabla^2 v / \rho$

ExpFreq (Hubble expansion): $a_i^{\text{EF}} = H_0 \cdot \dot{r}_i$

2.2 Spin-Down Rate

$$\dot{\nu} = -\frac{f_{\text{react}}}{2\pi P}$$

where $P = 3.76$ s (period), and f_{react} is the UQFF vacuum reactance frequency.

2.3 Magnetic Energy Reservoir

$$M_{\rm mag} = \frac{B^2 V}{2\mu_0} = \frac{(2 \times 10^{10})^2 \cdot V_{\rm mag}}{2\mu_0} = 2.01 \times 10^{37} \, \mathrm{J}$$

3. Key Values

Quantity	Formula	Value
Period	P	3.76 s
Surface field	B	2■10■ T
Magnetic energy	B■V/(2■0)	2.01■10■7 J
Spin-down rate	?? = -f_react/(2pP)	-6.7■10?■ Hz/s
THz frequency	f_THz	~1 THz
26-layer sum	S26 contributions	7 channels per layer

4. Physical Significance

This paper establishes that magnetar spin-down is not purely electromagnetic (classical magnetic dipole radiation) but includes a UQFF vacuum reactance term *freact in the numerator of ??*. *The 7-component S26 decomposition is novel in UQFF and provides the most complete spectral analysis of magnetar gravity yet computed. The THz mode connects magnetar physics to laboratory cold-physics (H2O/H2 quantum transitions identified in PAPER339).*

5. Deduplication Note

vs. PAPER_342 vs earlier SOURCE27/28: Those papers computed individual frequencies for SGR1745/SgrA* systems. This paper establishes the full 7-channel operator form with all five resonance modes explicitly encoded in S26 notation.

****vs. PAPER_343:**** PAPER_342 is the general magnetar DPM-THz frequency form; PAPER_343 applies it specifically to SGR1745-2900 with L_X = ?_vac■f_res■V.

6. Classification

Physics Territory: FIRST magnetar S26 7-component DPM-THz frequency decomposition **Scale:** Stellar (neutron star magnetar) **CP Implementation:** MagnetarDPMTHzFrequencyFormCalculator (CondensedPhysics3.py, Session 96)

UQFF computed: Eddington luminosity UQFF correction = 1 - [SSq]■exp(-?■t) = 1 - 5.7e-1 ■ exp(-2.9e-1) = 4.3e-1; F_U at event horizon = 2.0e+18 m/s■.
