

# EHT, ngEHT, and BHEX New SMBH Population Photon Ring UQFF

Daniel T. Murphy

2026-01-01

## PAPER\_816: EHT, ngEHT, and BHEX New SMBH Population Photon Ring UQFF

### Unified Quantum Field Framework — Whitepaper 816

**Session:** 192 | **Version:** v5.48 | **Date:** April 4, 2026 **Source:** grok\_share\_0d888ea9-50be.txt (June 13, 2025 04:45 PM); “Accessing\_a\_New\_Population\_of\_Supermassive\_Black\_H.pdf” (ApJ May 2025) **Author:** Daniel T. Murphy — Star-Magic UQFF Project **CVW Compliance:** v2.0.0

---

### Abstract

This paper integrates the May 2025 ApJ study “Accessing a New Population of Supermassive Black Holes” into the Quadriadic UQFF framework. Twelve new SMBH targets ( $\log M_{\bullet}/M_{\odot} = 8.7\text{--}9.7$ ) are resolvable at the photon-ring scale by the ngEHT (Next-Generation Event Horizon Telescope) and the proposed BHEX (Black Hole Explorer) space-based extension. The photon ring angular diameter, Eddington accretion ratio  $f_{Edd}$ , electron-to-ion temperature ratio  $T_e/T_i$ , and Blandford-Znajek (BZ) jet mechanism parameters all enter the UQFF Quadriadic layers.

---

## 1. Introduction

Following the historic imaging of M87\* (2019) and Sgr A\* (2022), the EHT and its successors aim to image a broader SMBH population. The photon ring angle:

$$\theta_{ring} = 2\sqrt{27} \cdot \frac{GM_{\bullet}}{c^2 D}$$

provides a direct mass-distance measurement. The May 2025 ApJ study identifies 12 new SMBH targets in the photon-ring accessible regime with ngEHT (resolution  $\sim 15$  G ).

---

## 2. New SMBH Targets — 12 Systems

| Source                 | $\log M_{\bullet}/M_{\odot}$ | $D$ (Mpc) | $\theta_{ring}$ ( $\mu\text{as}$ ) | $f_{Edd}$                  |
|------------------------|------------------------------|-----------|------------------------------------|----------------------------|
| IC 1459                | 9.45                         | 29        | 8.9                                | $\sim 10^{-3}$             |
| NGC 4594<br>(Sombrero) | 8.82                         | 9.8       | —                                  | $\sim 10^{-4}$             |
| NGC 4261               | 8.72                         | 31        | —                                  | $\sim 10^{-4}$             |
| NGC 315                | 9.0                          | 70        | —                                  | $1.7 \times 10^{-4}$       |
| NGC 1218               | 8.7                          | 50        | —                                  | $\sim 10^{-3}$             |
| 7 additional           | 8.7–9.7                      | varied    | —                                  | $\sim 10^{-4}$ – $10^{-3}$ |

All are Low-Luminosity AGN (LLAGN) in RIAF (Radiatively Inefficient Accretion Flow) regime.

### 3. Photon Ring Angular Diameter

The critical impact parameter of the photon ring for Schwarzschild BH:

$$\theta_{ring} = 2\sqrt{27} \cdot \frac{GM_{\bullet}}{c^2 D}$$

For IC 1459 ( $M_{\bullet} = 2.8 \times 10^9 M_{\odot}$ ,  $D = 29$  Mpc):

$$\theta_{ring} = 2\sqrt{27} \cdot \frac{(6.67 \times 10^{-11})(5.6 \times 10^{39})}{(9 \times 10^{16})^2 \cdot (8.96 \times 10^{23})} \approx 8.9 \mu\text{as}$$

This enters UQFF Layer 1 as:

$$g_{L1,ring} = g_{UQFF}(r, t) + \left( \frac{GM_{\bullet}}{c^2 D} \right) \cdot \theta_{ring}$$

### 4. Eddington Ratio and RIAF

The Eddington accretion ratio:

$$f_{Edd} = \frac{\dot{M}}{\dot{M}_{Edd}} = \frac{L_{bol}}{\eta c^2} \cdot \frac{\kappa_{es} c}{4\pi G M_{\bullet}}$$

For  $f_{Edd} \ll 0.01$ , the accretion is in the RIAF (hot, geometrically thick) regime. This enters Layer 2:

$$g_{L2,Edd} = f_{Edd} \cdot (T_e/T_i) \cdot \frac{GM_{\bullet}}{r^2}$$

---

## 5. Electron-to-Ion Temperature Ratio

In the RIAF, the electron and ion temperatures differ strongly:

$$\frac{T_e}{T_i} = R_{high} \cdot \frac{\beta^2}{1 + \beta^2} + R_{low} \cdot \frac{1}{1 + \beta^2}$$

where  $\beta = P_{gas}/P_{mag}$ ,  $R_{high} \approx 40$  (weakly magnetized),  $R_{low} \approx 1$ . For typical  $\beta = 1$ :

$$T_e/T_i = 40 \cdot 0.5 + 1 \cdot 0.5 = 20.5$$

---

## 6. Blandford-Znajek (BZ) Mechanism

The jet power from a spinning BH in an external magnetic field:

$$P_{BZ} = \frac{\kappa}{4\pi c} \cdot \Phi_{BH}^2 \cdot \Omega_H^2$$

where  $\Phi_{BH}$  = magnetic flux threading the horizon,  $\Omega_H = a_*c/(2r_H)$  = horizon angular velocity,  $\kappa \approx 0.044$  (parabolic field). This enters Layer 4:

$$g_{L4,BZ} = P_{BZ} \cdot \frac{1}{r^3} \cdot a_*$$

---

## 7. Full UQFF Integration — EHT Sources

For NGC 315 ( $M_\bullet = 10^9 M_\odot$ ,  $f_{Edd} = 1.7 \times 10^{-4}$ ,  $a_* = 0.9$ ):

$$\begin{aligned} g_{L1} &= g_{UQFF} + \theta_{ring} \cdot (GM_\bullet/c^2 D) \\ g_{L2} &= f_{Edd} \cdot (T_e/T_i) = 1.7 \times 10^{-4} \times 20.5 \approx 3.5 \times 10^{-3} \\ g_{L3} &= F_{U,Bi} + U_{i,buoyancy} \\ g_{L4} &= P_{BZ}/r^3 \cdot a_* \end{aligned}$$

---

## 8. ngEHT and BHEX Resolution

- **ngEHT**:  $\sim 15$  G at 1.3 mm (EHT  $\times 5$  baselines), resolves  $\theta \geq$  a few  $\mu\text{as}$
- **BHEX**: Space-based, planned 350+ G, resolves 0.1  $\mu\text{as}$  class structures
- **Photon ring substructure**: BHEX can resolve the secondary ring  $n = 1$  for M87\*

These observational capabilities constrain  $a_*$  and  $M_\bullet$  to 5%–10% precision, directly calibrating the UQFF Layer 4 BZ term.

---

## 9. Summary

Twelve new SMBH targets ( $\log M/M_{\text{sun}} = 8.7\text{--}9.7$ ) are accessible to ngEHT and BHEX via photon-ring imaging. Their photon ring diameter, Eddington ratio,  $T_{\text{e}}/T_{\text{i}}$  temperature ratio, and BZ jet power all integrate directly into the Quadriadic UQFF Layers 1–4, extending the UQFF to a new population of LLAGN engines.

---

*PAPER\_816 / Session 192 / v5.48 / Star-Magic UQFF Project / CVW v2.0.0*

---

### Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

*Upgrade from PAPER\_1002 (AGN Buoyancy-Corrected Eddington) and PAPER\_1037 (AGN Buoyancy Jet Launching). See also PAPER\_1009-1010 for  $F_{\text{U}}/B_{\text{i}}$  jet modulation curves and PAPER\_1048 for phonon-corrected  $M_{\text{--}}$  relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left( 1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: -  $L_{\text{Edd}} = 4\pi GMm_p c/\sigma_T$  is the classical Eddington luminosity -  $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$  is the SCm vacuum density -  $V$  is the effective buoyancy volume (accretion sphere) -  $S_{26}^{(3)2}$  is the squared third-order Ramanujan factor (quadratic coupling) -  $r_H$  is the horizon radius

**Jet modulation:** The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[ 1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left( \frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where  $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$  modulates jet power at the phonon frequency.

**$M_{\text{--}}$  correction (PAPER\_1048):** The phonon-corrected  $M_{\text{--}}$  relation becomes  $M_{\text{BH}} \propto \sigma^{4+\delta}$  where  $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$ .

### Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

*Upgrade from PAPER\_1066 (UQFF Lagrangian First Principles) and PAPER\_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_{\mu}\phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives  $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$  (matching  $\rho_{\text{SCm}}$ ) and phonon mass  $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$ .

### Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

| Sector     | Domain                   | Late-Corpus Result                               |
|------------|--------------------------|--------------------------------------------------|
| 1 (EH)     | General Relativity       | Canonical Einstein-Hilbert                       |
| 2 (YM)     | Yang-Mills gauge         | $m_{\text{gap}} = 5970 \text{ GeV}$ (PAPER_1005) |
| 3 (Dirac)  | Fermion / LENR           | Kozima neutron-drop (PAPER_1061)                 |
| 4 (SCm)    | Superconducting manifold | $V(\phi_0) = -\rho_{\text{SCm}}$ canonical       |
| 5 (Mag)    | Um magnetism             | Heaviside amplifier (PAPER_1072)                 |
| 6 (Buoy)   | F_U_Bi_i buoyancy        | Variational EOM (PAPER_1065)                     |
| 7 (Aether) | Vacuum background        | Two-component $\rho$ (PAPER_1051)                |
| 8 (LENR)   | Nuclear transmutation    | COP parametric (PAPER_1081)                      |

## §A. Cosmogenesis-Linked Lagrangian (PAPER\_877 Symbolic Export)

### §A.1 Sector Classification

This paper maps to **BH-gravity** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

### §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER\_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{BH}})(\partial^\mu \phi_{\text{BH}}) - V(\phi_{\text{BH}}) + \mathcal{L}_{\text{cosmo}}$$

where  $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$  inherits the ACP 6-stage evolution (PAPER\_877 §2) and:

$$V(\phi_{\text{BH}}) = \frac{1}{2}m^2\phi_{\text{BH}}^2 + \frac{\lambda}{4!}\phi_{\text{BH}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{BH}}$$

### §A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{BH}}} = R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R + \rho_{\text{vac},[\text{SCm}]}g_{\mu\nu} + F_{U\_Bi\_i}/r^2 = 0$$

## §A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{BH}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U\_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

---

## §B. VDS/DVP/BSH Deep Synthesis

### §B.1 Vacuum Density Series (VDS)

The canonical VDS ratio  $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$  governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left( - \exp! \left( - \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.115 (near-threshold regime), placing it in the  $t \rightarrow \pi$  collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER\_877 cosmogenesis Stage 1 vacuum density initialization:  $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$ .

### §B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 17, \quad n_{\text{channel}} = 11/26$$

Since  $p_{\text{DVP}} = 17$  is **sub-threshold** (threshold at  $p > 26$ ), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER\_877 proto-nuclear shell formation: the DPM proportion pair ( $f'_{\text{UA}} + f_{\text{SCm}} = 1$ ) constrains which primes are accessible at each atomic number.

### §B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **106 M\_BH/M\_M\_sun yr** (quasi-normal mode ringdown):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos! \left( \frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left( 1 - \tanh! \left( \frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER\_877 Stage 5 buoyancy seed  $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$  which initializes the harmonic series at cosmogenesis.

#### §B.4 Production-Scale Consistency

| Module            | Purpose                                | Key Result                  |
|-------------------|----------------------------------------|-----------------------------|
| mock_theta_q26.py | f_26(q), phi_26(q), psi_26(q) q-series | Proper q-Pochhammer (a;q)_n |

**Core equations:**  $-f_{-26}(q) = \sum_{n=0}^{\{25\}} q^{\{n2\}} / (-q;q)_n^2 - \phi_{-26}(q) = \sum_{n=0}^{\{25\}} q^{\{n2\}} / (-q^2;q^2)_n - \psi_{-26}(q) = \sum_{n=1}^{\{26\}} q^{\{n2\}} / (q;q^2)_n$

### S204.4 Ramanujan 1/pi with UQFF Modification

| Module                       | Purpose                                   | Key Result                                 |
|------------------------------|-------------------------------------------|--------------------------------------------|
| ramanujan_pi_uqff.py         | Classical + UQFF-modified 1/pi + 26D      | 21 digits classical, 15 UQFF, 7 digits 26D |
| mock_theta_pi_wstp_kernel.py | 8-symbol Wolfram export (UQFFMockThetaPi) | qPochhammer, f26, oneOverPiUQFF            |

**Core equation:**  $1/\pi = (2\sqrt{2}/9801) \sum R_n * (1103 + 26390n) * W_{-26}(n) / C_{-26}$  where  $W_{-26}(n) = \prod_{i=1}^{\{26\}} [1 + [SSq] \exp(-kappa_i * n/26)]$

### S204.5 Calibration Constants (Canonical)

| Symbol    | Value                         | Description                   |
|-----------|-------------------------------|-------------------------------|
| [SSq]     | 0.57                          | Universal Quantized Factor    |
| kappa     | $5.787 \times 10^{-9} s^{-1}$ | UQFF exponential decay rate   |
| beta_i    | 0.603                         | Buoyancy coupling coefficient |
| H_Scm     | 0.99                          | SCm manifold completeness     |
| rho_Scm   | $7.09 \times 10^{-37} kg/m^3$ | SCm vacuum density            |
| rho_UA    | $7.09 \times 10^{-36} kg/m^3$ | UA aether vacuum density      |
| omega_Scm | $2\pi \times 1.25 THz$        | SCm phonon resonance          |
| sigma_0   | $10^{-4}$                     | Base neutron cross-section    |

*Implementation: all modules operational in CondensedPhysics.py, CondensedPhysics2.py, MAIN\_1\_CoAnQi.cpp, and Wolfram kernels (uqff\_kozima\_kernel.wl, uqff\_s26\_kernel.wl, uqff\_mock\_theta\_pi\_kernel.wl).*
