Abstract

The Whirlpool Galaxy (M51a / NGC 5194) and its companion M51b (NGC 5195) form a spectacular interacting pair 23 Mly away. Tidal forces from M51b drive the prominent spiral arm structure and enhance star formation rates.

1. System Parameters

Parameter	Value
M_{M51a}	$1.6 \times 10^{11} M_{\odot}$
M_{M51b}	$2 \times 10^{10} M_{\odot}$
Separation	7.5 kpc
SFR	$3 M_{\odot}/\text{yr}$

2. Tidal Force

$$F_{tidal} = \frac{2GM_{comp}R_d}{d_{sep}^3}$$

This differential force stretches M51a's disk and drives arm formation.

3. Spiral Arm Pitch Angle

$$i_{pitch} = \arctan\left(\frac{F_{tidal}}{v_c^2/R}\right)$$

4. UQFF MUGE for M51

$$g_{M51} = \frac{G(M_a + M_b)}{r^2} (1 + H(z)) + \rho_{ISM} V g \frac{\rho_{SCm}}{\rho_{UA}}$$

5. UQFF Star Formation Efficiency

$$\text{SFE}_{UQFF} = \text{SFR} \left(1 + \frac{F_{tidal}}{g_{grav}} \right) (1 + f_{TRZ})$$

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{UQFF} = \mathcal{L}_{GR} + \mathcal{L}_{SCm} + \mathcal{L}_{phonon} + \mathcal{L}_{interaction}$$

$$\mathcal{L}_{SCm} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{SCm}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{phonon} = \sqrt{8\lambda} v_{SCm}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{EH} + \mathcal{L}_{YM} + \mathcal{L}_{Dirac} + \mathcal{L}_{SCm} + \mathcal{L}_{mag} + \mathcal{L}_{buoy} + \mathcal{L}_{aether} + \mathcal{L}_{LENR} + \mathcal{L}_{KK}$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **galaxy-rotation** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{rot}})(\partial^\mu \phi_{\text{rot}}) - V(\phi_{\text{rot}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{rot}}) = \frac{1}{2}m^2\phi_{\text{rot}}^2 + \frac{\lambda}{4!}\phi_{\text{rot}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{rot}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{rot}}} = v_c^2/r - \mu_s \nabla(M_s/r) - F_{U_Bi_i}/(m \cdot r) + \rho_{\text{vac},[\text{SCm}]} \cdot \Omega^2 r = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{rot}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.116 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 5, \quad n_{\text{channel}} = 17/26$$

Since $p_{\text{DVP}} = 5$ is **sub-threshold** (threshold at $p > 26$), the system’s vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **109 yr** (disk settling timescale):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[\text{SSq}] \cdot m/M_{\odot}}\right) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
